## Executive Summary

Freeway and arterial ITS systems provide a high degree of benefit, particularly in the area of travel reliability, despite their relatively small portion of overall transportation budgets. For example, by keeping users apprised of incidents and other delays after they have started their trips, and facilitating quick removal of incidents, ITS provides a crucial service that cannot be replaced by capital investments alone. Users of the system benefit from this increased consistency of their daily commutes, though they may not appreciate the ITS investments that contribute significantly to these outcomes.

Many agencies have conducted benefit/cost analyses to evaluate the economic merits of new or continued investments in ITS technology. Characterizing and documenting the ITS benefits, including cost-benefit ratio and magnitude of annual cost savings provided by the system, can prove crucial to establishing an effective and persuasive business case for sustained, continued, dedicated system funding.

## Analysis Approach

In recognition of these objectives, this business case report presents the approach, results, and conclusions of a carefully conducted benefit/cost analysis of the ITS investments and TSMO strategies in the Orlando Urban Area. The approach taken for this analysis is to utilize the Tool for Operations Benefit/Cost (TOPS-BC),<sup>1</sup> which is a tool developed by FHWA that offers reasonable estimates of the economic impacts and generalized outcomes associated with various ITS. The analysis is performed in the context of existing conditions in the tri-county area. A sensitivity analysis is also included to explore the impacts of alternative analysis assumptions on the overall benefit/cost outcomes.

## Findings

The overall annual monetized benefit associated with Intelligent Transportation Systems (ITS) in the Orlando Urban Area (Orange, Osceola, and Seminole Counties) is \$70.3 million, or \$421k per mile. Of this, approximately \$21.8 million (or 31% of the total) is a result of delay savings, \$33.0 million (47%) is a result of crash-related savings (damage and injury costs), \$11.3 million (16%) is a result of annual fuel savings, and \$4.2 million (6%) is captured by bus passengers through the transit strategies. Table ES.1 provides a summary of these benefits per mile, separately by outcome type.

**Table ES.1 Benefits for All Counties by Improvement Type**

Benefit Category	Total Benefit	Per-Mile Benefit
Delay Savings Associated with Recurrent Congestion	\$787,086	\$4,991
Incident Management: Delay Savings	\$20,964,220	\$132,937
Incident Management: Crash Reduction Benefits	\$33,007,268	\$209,304
All Strategies: Fuel Savings	\$11,304,050	\$71,681
Transit Delay Savings	\$4,239,291	\$2,033
Total Benefits	\$70,301,914	\$420,947

<sup>1</sup> Available from FHWA: <http://www.ops.fhwa.dot.gov/plan4ops/topsbctool/index.htm> (accessed 10-19-2016).

The overall annual cost associated with ITS investments in the Orlando Urban Area is \$13.8 million, or \$72k per mile. Of these costs, approximately \$7.1 million (or 52% of the total) is associated with signalization improvements, \$2.8 million (20%) is related to incident management, \$1.3 million (10%) is attributed to travel time information systems, and \$2.5 million (18%) is invested in transit improvements. Table ES.2 provides a summary of these costs separately by ITS strategy category.

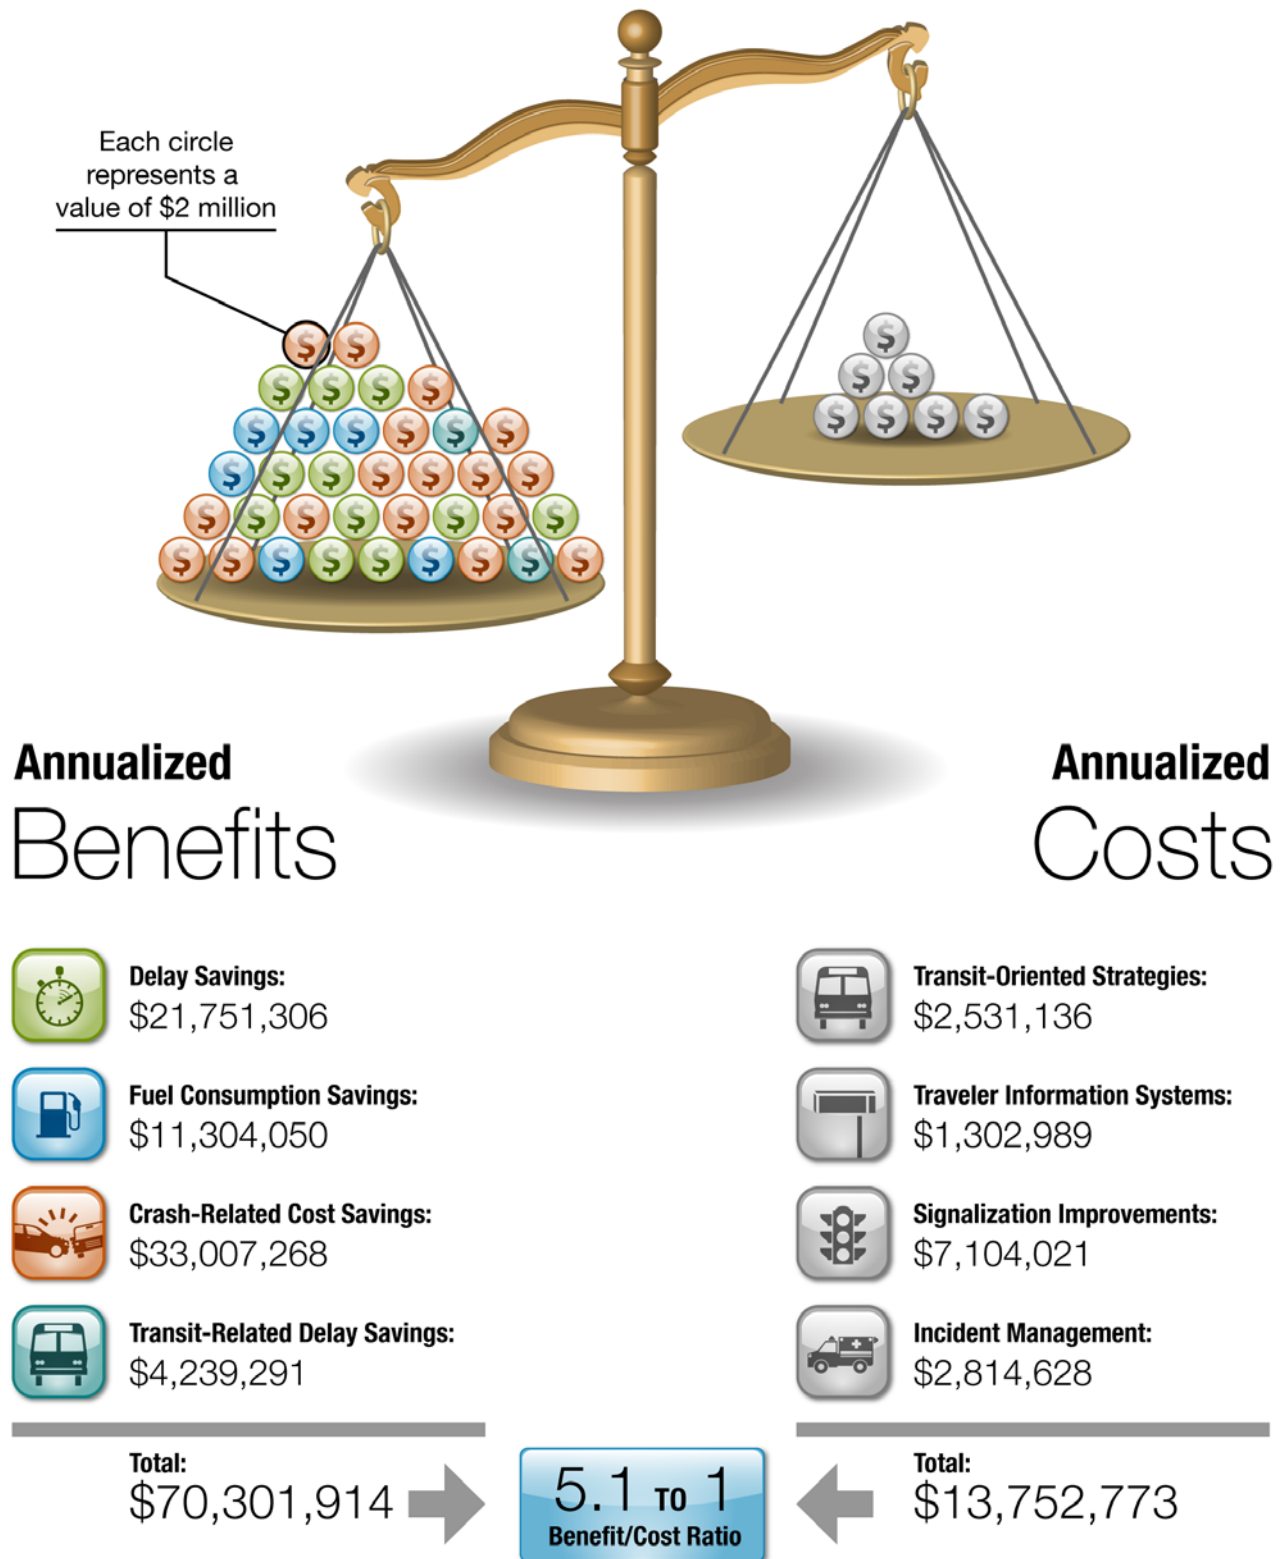

**Table ES.2 Annualized Costs for All Counties by ITS Strategy Category**

Cost Category	Total Annual Cost	Per-Mile Annual Cost
Signal Improvements	\$7,104,021	\$45,048
Incident Management	\$2,814,628	\$17,848
Travel Time System	\$1,302,989	\$8,262
Transit Strategies	\$2,531,136	\$1,214
Total Annualized Cost	\$13,752,773	\$72,372

Given these annual benefits and costs, the combined ITS strategies have an overall benefit-cost ratio of 5.11 to 1 as shown in Figure ES.1.1 Put another way, every \$1.00 invested in ITS in the Orlando Urban Area generates more than \$5.11 in benefits for users of those facilities. Alternatively, a decision not to fund these strategies could be expected to result in a net loss to the public of \$56.5 million annually.

The benefits were well distributed across the region, with all three counties shown to benefit substantially from their respective ITS investments across these categories. Specifically, Orange County benefits the most from ITS strategies in terms of absolute dollar amounts, with a countywide benefit of \$34.3 million annually compared to \$26.3 million for Seminole County and \$9.8 million for Osceola County. Normalizing these benefits by mileage, Seminole County exhibits the highest dollar value of annual benefits per mile at \$678k, compared to \$337k per mile in Orange County and \$349k per mile in Osceola County. From a cost perspective, Osceola was the most efficient with an estimated per-mile rate of \$50k for all ITS strategies combined, compared to \$71k per mile in Orange County and \$93k per mile in Seminole County. Bringing together the benefit and cost results by county, the benefit-cost ratio is found to be highest for Seminole County at 7.3 to 1, compared to 7.0 to 1 for Osceola County and 4.8 to 1 for Orange County.

**Figure ES.1.1 Summary of Benefit-Cost Analysis Results across All Corridors**

## Conclusions

This business case analysis used a nationally recognized benefit/cost estimation tool from FHWA, informed by years of research projects and empirical data from leading studies across the country, and applied it to detailed ITS inventory/deployment data and traffic/roadway configuration data from the Orlando Urban Area to obtain reliable estimates of overall ITS-related benefits and costs throughout the region and by county. Impact parameters were tailored to each of the 326 analysis segments according to their specific characteristics, and benefits for each segment were estimated using high-fidelity hourly volume data to achieve the highest level of analysis precision possible.

Across all counties and all analysis scenarios, the ITS strategies deployed in the Orlando Urban Area consistently demonstrated a significant value across several categories, including fuel savings, time/delay savings, crash injury/damage cost savings, and improved transit performance/efficiency. The analysis revealed a regionwide annual benefit of \$70.3 million against a cost of \$13.8 million, for a benefit-cost ratio of 5.1 to 1.

These findings were found to be resilient even when subjected to double-digit levels of uncertainty regarding the input parameters used to produce these results, as demonstrated by the outcomes of the sensitivity analysis scenarios. Across a set of six scenarios designed to examine the effects of reasonable ranges of uncertainty associated with several key analysis parameters, the net benefit was always above \$49 million per year, resulting in benefit-cost ratios well in excess of 4:1 in all cases.

## 1.0 Introduction

### 1.1 Background

Since its establishment in 1977, MetroPlan Orlando has been responsible for ensuring that the region's transportation infrastructure is operated and managed efficiently and safely, and has taken a leading regional role in facilitating interagency coordination and cooperation in pursuit of an effective and diverse regional transportation system. Several of the region's strategic overall objectives include:

- Improving safety and mobility,
- Reducing congestion,
- Providing information to motorists, and
- Sharing information with stakeholders.

Intelligent Transportation Systems (ITS) have had a central role in accomplishing these objectives among all major member agencies of MetroPlan Orlando, enabling the region to efficiently operate the region's freeways and major state route arterial roadways by utilizing some of the most advanced traffic management technologies available. It is a robust system that includes (among many strategies) the following key components:

- Transit-oriented strategies (e.g., Transit Signal Priority, Automated Vehicle Location Services);
- Traveler information dissemination (e.g., dynamic message signs, Florida 511);
- Incident management strategies (e.g., emergency vehicle pre-emption, CCTV, Road Rangers service patrol); and
- Signalization improvements (e.g., signal retiming studies, coordinated control).

This business case analysis quantitatively evaluates the current performance of these ITS strategies, to provide a sense of the value associated with past and ongoing investment in these systems.

### 1.2 What Makes a Business Case

The primary purpose of any business case is to provide agencies with the resources, data, and materials they need to present a compelling investment justification to decision-makers and agency leadership. This includes coverage of such integral topics as:

- Demonstrating how ITS investment and its associated outcomes aligns with agency goals.
- Identifying the needs that are met or addressed through different types of ITS investment.
- Quantifying the economic outcomes of the investment in terms of costs and benefits, both to the agency and to the broader public.

- Presentation of transparent calculations, assumptions, inputs, and outputs, to instill trust in the business case analysis.
- Conducting a sensitivity evaluation and risk analysis associated with realistically plausible outcomes, rather than just a single point estimate of benefits and costs.
- Demonstrating the comparative value of TSMO against other alternatives for investment, including “do nothing.”

Altogether, these topics are intended to provide actionable information, accompanying motivation, and data-driven justification for continued investment in and support of MetroPlan’s ITS program among key stakeholders including executive leadership, partner agencies, and the traveling public.

### 1.3 Target Audiences

Identifying the intended audiences of a business case is paramount to developing materials that most effectively resonate with them and their needs, priorities, and goals. A business case is not a strategy for communicating how ITS has solved MetroPlan’s problems, but rather a vehicle for showing how it has addressed the interests and concerns of the target audiences. These include:

- Executive leadership;
- Decision-makers and politicians;
- Member agencies and their staffs at various levels;
- Regional partners and major stakeholders; and
- The traveling public.

Obtaining an understanding of the target audiences’ contexts enables the selection communications strategies that are suitable and relevant to them according to the anticipated engagement opportunities that may be expected. This includes consideration of format, length, and content. Examples of several different communication strategies, formats, and priority topics for business case materials are available separately in SHRP2’s report, Business Case Primer: *Communicating the Value of Transportation Systems Management and Operations*.

The different business case materials and content available within this business case report are summarized in Table X below by the intended audience type and/or desired level of detail.

**Table 1.1 Business Case Materials in this Report**  
by intended use

Business Case Materials	Intended purpose, audience, and/or level of detail
Summary Graphics (see Figure ES.1.1)	A concise summary of the key benefit/cost results only. Ideal for starting the conversation about the benefits and value of the ITS in the Orlando Urban Area. Suitable for non-technical audiences that do not have a detailed working knowledge of ITS or transportation engineering/planning.
Executive Summary	A summary of the benefit/cost results with additional interpretive notes, contextual information, and discussion regarding the significance of these findings for more informed policy and decision support. Suitable for audiences with a basic understanding of ITS.
Main Report Body (Chapters 2-5)	A description of the basic analysis approach, assumptions, inputs, procedures, and references used to obtain the results shown in the executive summary. Also includes a more detailed presentation of findings associated with the benefit/cost analysis, and a more thorough treatment of the assumptions and the sensitivity of the results to those assumptions. Suitable for technical audiences familiar with ITS that want a more thoughtful understanding of how the results were obtained, and what they show more precisely.
Full Report with Appendices	A full explanation of all data, parameter values, assumptions, calculations, and procedures used in this analysis, suitable for critical analysis and sufficient to allow the reader to reproduce the results shown. Suitable for technical audiences with a basic understanding of the principles of economic analysis and standard practice associated with transportation planning/engineering benefit/cost evaluations.

As summarized in Table 1.1, this complete business case report provides detailed quantitative results for a number of ITS technologies and scenarios, presented with transparent calculations and a clearly-defined methodology that are ideal for analytical and technical audiences including project evaluators and reviewers. Several summary figures are also provided in the results section that convey the key findings and outcomes in a concise, graphical format that is both visually engaging and powerfully intuitive—qualities that make these figures ideal for short publicity engagements and public outreach opportunities. Finally, an Executive Summary chapter is provided at the front of this document that provides more background and contextual information than the standalone graphics while still maintaining a higher-level perspective and concise writing style suitable for executive leaders, decision-makers, and other audiences that need to quickly understand the key elements and conclusions of this ITS business case in a carefully prepared summary that is highly time-efficient.

## 1.4 Context in the Master Plan

This business case is only one element of the overall MetroPlan Orlando ITS Master Plan, and while this document is written to function as a standalone work product, its full relevance is realized only when it is considered within the context of the other tasks on this project. This business case analysis builds upon the findings and products of other project tasks, including the following contributing components:

- Goals and objectives that have been articulated in other parts of the MetroPlan Orlando ITS Master Plan, which provides a basis for identifying benefit categories and performance measures.
- Inventory data, which is essential to the development of costs and the expected geographic extent and magnitude of benefits associated with these ITS strategies.
- Existing conditions data, which are required to evaluate performance measures with and without the ITS strategies.

The outcomes and results of this business case analysis also inform other components of the project, including the following:

- The Needs Analysis, which will be used to help identify future proposed deployments and to establish priorities.
- Planning work associated with future ITS activities, as informed by the benefit/cost evaluation and subsequent prioritization of various proposed strategies.

## 1.5 Organization of this document

The remaining chapters and appendices of this business case report cover all major topics and components of a proper business case as described above. The chapters of the report body are organized as follows.

- A high-level description of the analysis methodology used to evaluate the costs and benefits of the ITS infrastructure and strategies deployed in the Orlando Urban Area is provided in Chapter 2. Additional details are available in Appendices B and C.
- Analysis results are provided in Chapter 3, which include an evaluation of system benefits, system costs, and benefit/cost ratios. Results are separated by jurisdiction and by strategy type where available. Additional details are available in Appendix D.
- A sensitivity analysis is provided in Chapter 4, which explores the sensitivity of the findings of Chapter 3 with respect to six different alternative analysis assumptions and sets of parameter values. Additional details are available in Appendix D.
- A summary of conclusions and next steps is provided in Chapter 5.

The four report appendices provide additional details and data associated with the above core document chapters and topics. The organization of the appendix materials is as follows.

- An overview of all relevant equipment inventory data, source traffic data, roadway characteristics, population data, fleet data, and other referenced input data is provided in Appendix A.
- Building upon the content of Chapter 3, additional specifics, procedural details, parameter values, intermediate analysis results, and assumptions associated with the benefit analysis are provided in Appendix B.
- Expanding upon the content of Chapter 3, additional specifics, procedural details, parameter values, intermediate analysis results, and assumptions associated with the cost analysis are provided in Appendix C.
- To supplement the results presented in Chapters 4 and 5, more detailed numbers and disaggregated results associated with the baseline benefit/cost analysis and the six sensitivity analysis scenarios are provided in Appendix D.

## 2.0 Benefit-Cost Analysis Methodology

The approach taken for this analysis is to utilize the Tool for Operations Benefit/Cost (TOPS-BC),<sup>2</sup> which is a tool developed by FHWA that offers reasonable estimates of the economic impacts and generalized outcomes associated with various ITS.

TOPS-BC has the capacity to estimate benefits and costs associated with several types of common ITS strategies using several representative parameter values informed by literature; outcomes associated with other ITS strategies not explicitly covered in a module of TOPS-BC can be estimated as long as key benefit and cost parameters are available (or assumed by the analyst). A sample of the module used to estimate the ITS benefits for the MetroPlan ITS analysis is shown in Figure 2.1, where input parameters would be specified in green cells, default input parameters provided in yellow cells (superseded by green cells when provided), and calculated values in blue cells.

**Figure 2.1 OPS-BC Input Sheet Example**

**FHWA Tool for Operations Benefit/Cost (TOPS-BC): Version 1.0**  
Estimate Benefits of TSM&O Strategies

Strategy: Traffic Incident Management

Length of Analysis Period (Hours)

Cost Information

Facility Characteristics	Link Facility Type	Link Length (Miles)	Total Number of Lanes	Link Capacity (All Lanes - Per Period)	Free Flow Speed (MPH)
	Urban Freeway	2.44	7	15400	65

Facility Performance	Link Volume (Per Period)	Congested Speed	Vehicles Miles Traveled (VMT)	V/C	Vehicle Hours of Travel	Incident Related Delay (hours) per vehicle per mile	Number of Fatality Crashes	Number of Injury Crashes	Number of Property Damage Only Crashes	Fuel consumption (Gallons)
	9779	59.035	23860.7600	0.6350	404.1801	0.00027267	1.57481E-06	1.13649E-04	1.47245E-04	1123.1754

Facility Improvement models	Change in Capacity (%)	Change in Speed (%)	Change in # of Lanes
	0%	0%	0

For the analysis, TOPS-BC has been used in conjunction with detailed inventory and traffic data for each corridor, as shown in Appendix A. The analysis is performed in the context of existing conditions in the tri-county area. The following sections describe the methodology and assumptions associated with this analysis approach. Additional detail regarding the benefit and cost analysis procedures, assumptions, and inputs is provided in Appendix B and Appendix C.

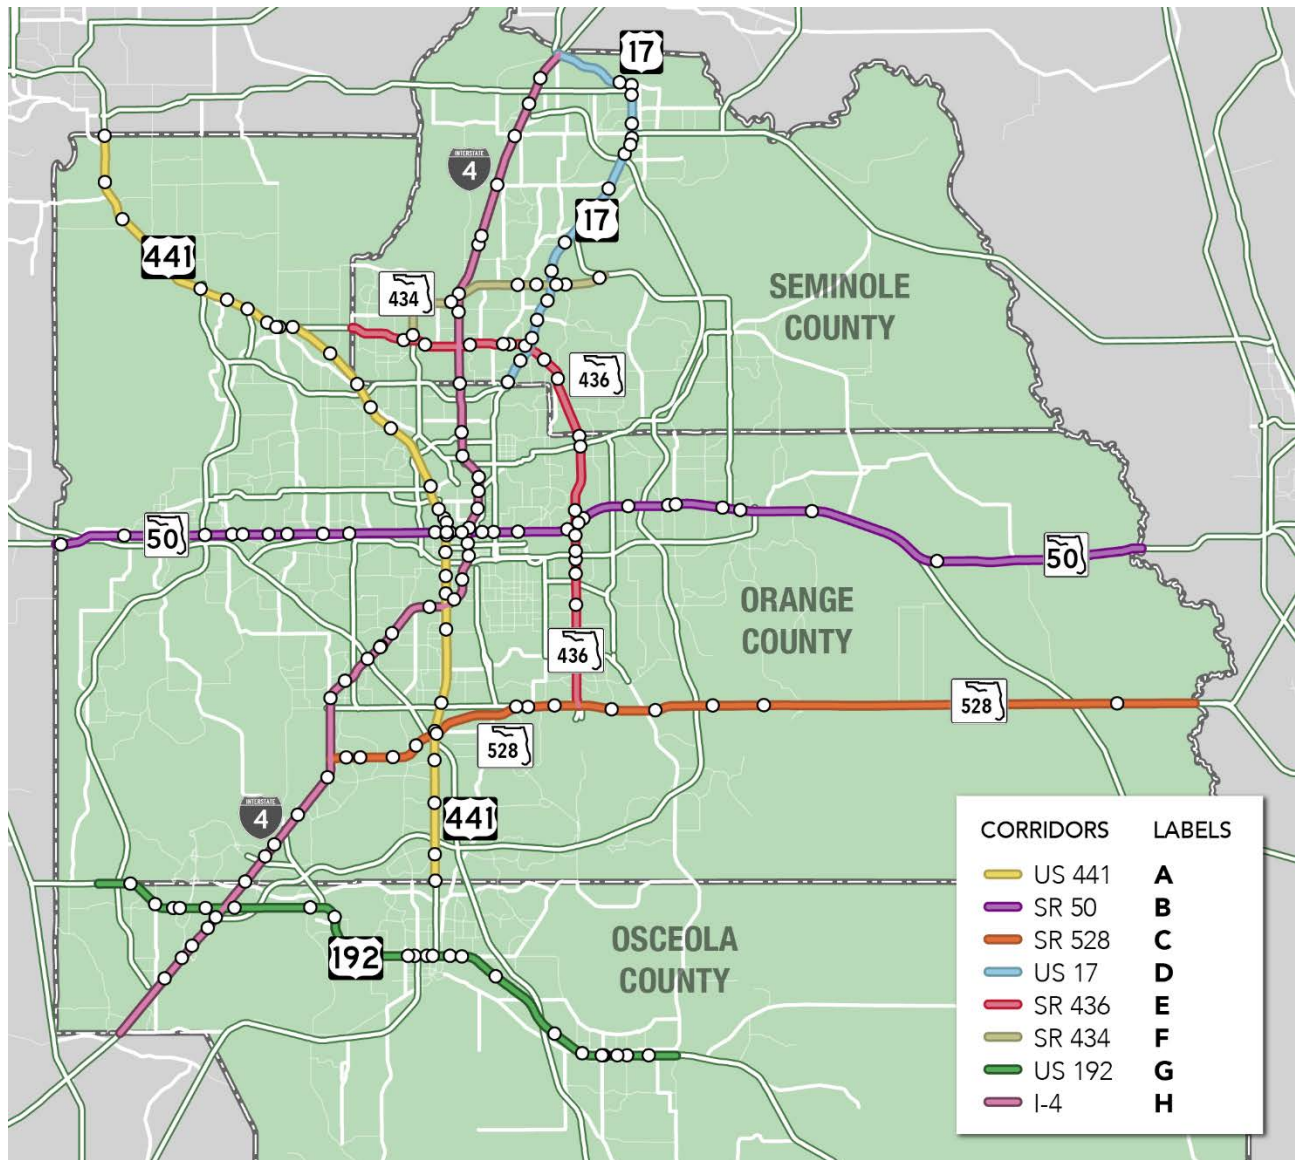

<sup>2</sup> Available from FHWA: <http://www.ops.fhwa.dot.gov/plan4ops/topsbctool/index.htm> (accessed 10-19-2016).

## 2.1 Geographic Scope of Analysis

Eight analysis corridors have been considered for this analysis, as shown in Figure 2.1. These corridors are furthermore subdivided into analysis segments based on the locations of available traffic data. Each data location corresponds to a separate analysis segment, defined by the midpoints between it and the nearest neighboring data locations upstream and downstream on the corridor. Altogether, there are 326 directional analysis segments across these eight corridors, with an average length of 1.5 miles each. Throughout this report, the eight analysis corridors will be referred to using the labels A-H as indicated in the figure.

Two important exceptions to this geographic scope of analysis are the transit component and the limited consideration of supplemental routes as described in Section 2.4. As a result of input data limitations, costs and benefits for AVL and TSP are evaluated across all LYNX routes, and are not limited to the eight corridors indicated in Figure 2.2.

**Figure 2.2 Map of Analysis Corridors and Traffic Data Location**

Traffic volume data locations are indicated by white circles on the map.

## 2.2 Benefit Analysis

Benefits are calculated using a set of safety, mobility, and environmental impact parameters associated with each of the broad improvement categories shown in Table 2.1. These impacts are then scaled down according to the extent to which ITS has been deployed on a given corridor, such that a segment with relatively little coverage is estimated to achieve a proportionally smaller level of benefit relative to comparable segment with much more ITS infrastructure.

**Table 2.1 Mapping of ITS Project Types to TOPS-BC Improvement Categories**

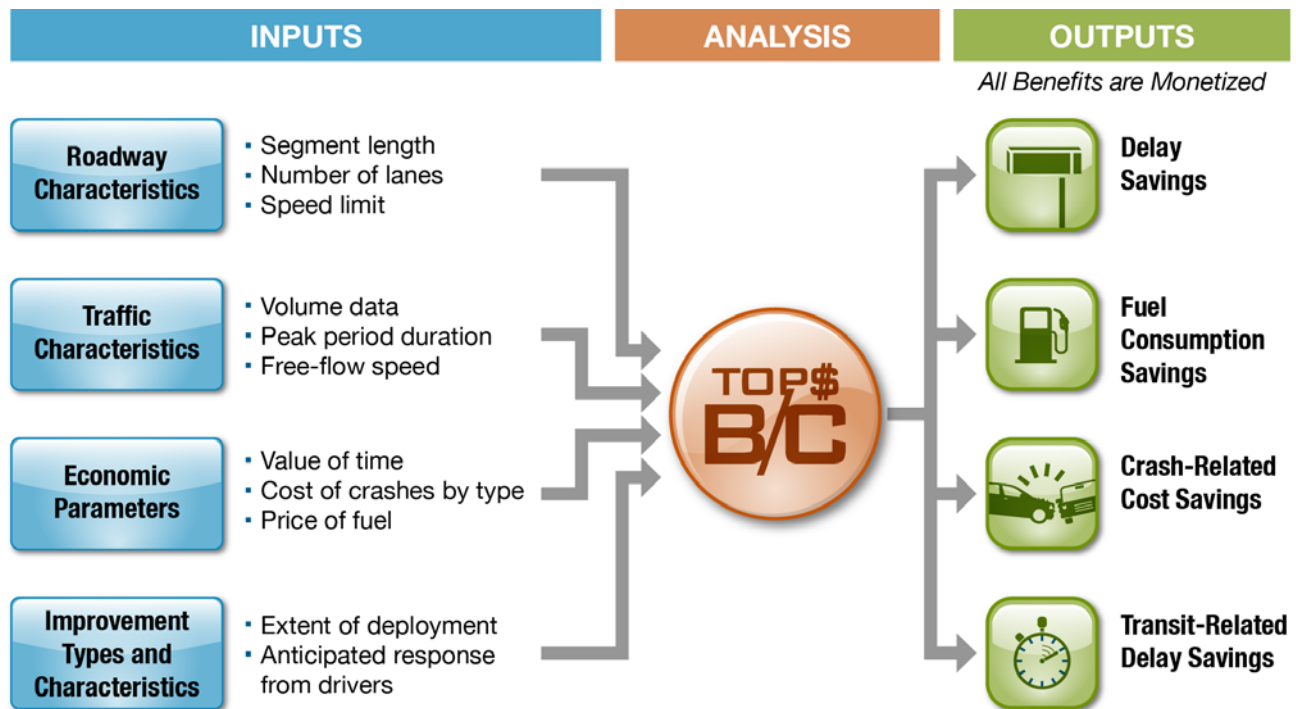

TOPS-BC Improvement Category	ITS Project Types Included
Signalization Improvements	<ul style="list-style-type: none"> <li>Signal Retiming Studies (arterials only)</li> <li>Coordinated Signal Control Systems (arterials only)</li> </ul>
Incident Management Strategies	<ul style="list-style-type: none"> <li>CCTV</li> <li>Emergency Vehicle Pre-emption (arterials only)</li> <li>Road Rangers Service Patrol (freeways only)</li> </ul>
Travel Time System	<ul style="list-style-type: none"> <li>On-road Traveler Information System (using DMSs)</li> <li>511 Traveler Information System</li> </ul>
Transit Strategies <sup>3</sup>	<ul style="list-style-type: none"> <li>Transit Signal Priority</li> <li>Automatic Vehicle Location Service</li> </ul>

These impact parameters are combined with basic traffic and roadway configuration details to obtain benefit estimates from TOPS-BC in the following four categories:

- Monetized fuel savings across all strategies.
- Direct cost savings of incidents prevented (or reduced in severity).
- Monetized delay savings associated with incident management strategies.
- Monetized delay savings achieved through traveler information strategies associated with recurrent congestion.

Finally, these quantities are aggregated across all hours of the day to obtain daily estimated benefits by category for each segment, and scaled by a factor of 250 to obtain annual benefit estimates by segment and improvement category. The overall TOPS-BC benefit estimation process is summarized in Figure 2.3.

<sup>3</sup> Note that this is not a TOPS-BC improvement category—rather, these calculations will be performed following the procedure described in the subsequent transit benefits section.

**Figure 2.3 Summary of Benefit Estimation Process for TOPS-BC**

### 2.2.1 Transit-Specific Benefit Analysis

Because the benefits associated with transit-specific strategies cannot be directly evaluated using the current version of TOPS-BC, the procedure used to estimate these benefits was to assume a travel time savings of 10 seconds per transit passenger at each intersection equipped with TSP along a bus route, combined with an assumed savings of 1 minute per trip as a result of fleet-wide AVL data. This AVL-related savings per trip is based on an assumed overall savings of 4 minutes per trip when the system is used, and a further assumption that 25% of riders use the system.

This 10-second TSP-related savings and 1-minute AVL savings is then scaled appropriately based on statistics from LYNX, the Central Florida Transportation Authority, regarding ridership, passenger-miles traveled, directional miles of bus routes, and the number of signalized intersections per route.

## 2.3 Cost Analysis

Costs are calculated by considering the individual capital, operating, maintenance, integration, and labor expenses that are associated with each ITS strategy component, including both field equipment and supporting systems (hardware and software). Non-recurring costs are amortized according to estimated useful life of each component, and combined with annual estimates for other costs to obtain annualized estimates that are suitable for comparison to the estimated annual benefits described in the preceding section.

Table 2.2 indicates the different cost components taken into consideration for each ITS strategy. These costs are then consolidated into suitable improvement categories for more concise reporting as shown in Table 2.3. The overall TOPS-BC cost estimation process is summarized in Figure 2.4.

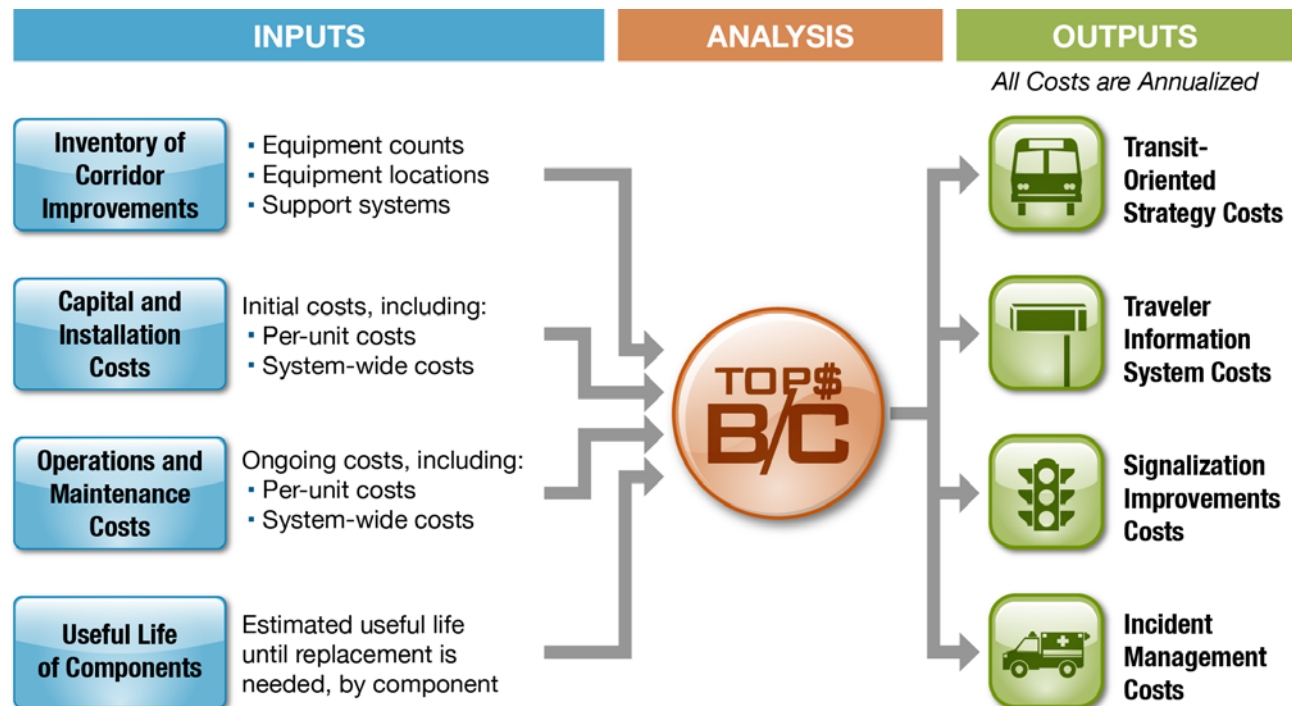

**Table 2.2 Component Summary by ITS System**

ITS System	Direct Cost Components (per Field Deployment)	Indirect Cost Components (e.g., Integration, Monitoring)
CCTV	<ul style="list-style-type: none"> <li>• Video camera</li> <li>• Camera pole</li> </ul>	<ul style="list-style-type: none"> <li>• Hardware/software for central CCTV monitoring</li> <li>• System integration</li> </ul>
Ramp Meters	<ul style="list-style-type: none"> <li>• Ramp meter signal/controller</li> <li>• Loop detectors (two)</li> <li>• Communication line</li> </ul>	<ul style="list-style-type: none"> <li>• TMC hardware for freeway control</li> <li>• TMC software/integration</li> <li>• Labor</li> </ul>
DMS Traveler Information	<ul style="list-style-type: none"> <li>• Changeable message sign</li> <li>• Support structure</li> <li>• Communication line</li> </ul>	<ul style="list-style-type: none"> <li>• TMC hardware and software for information dissemination</li> <li>• TMC system integration</li> </ul>
511 Traveler Information System	<ul style="list-style-type: none"> <li>• None</li> </ul>	<ul style="list-style-type: none"> <li>• Information Dissemination Hardware, Software, Integration, Labor</li> <li>• Transit Center Hardware, Software, Integration, Labor</li> <li>• Communication Lines</li> <li>• Information Service Center Hardware, Software, Integration, Labor</li> <li>• Map Database Software</li> </ul>
Fiber Optic	<ul style="list-style-type: none"> <li>• Installation of physical cable</li> <li>• Capital cost of physical cable</li> </ul>	<ul style="list-style-type: none"> <li>• None</li> </ul>
Centralized Traffic Signal Control	<ul style="list-style-type: none"> <li>• Signal Controller</li> <li>• Communication Line</li> <li>• Loop Detectors (2)</li> </ul>	<ul style="list-style-type: none"> <li>• Linked Signal System LAN</li> <li>• TMC Hardware for Signal Control</li> <li>• TMC Software/System Integration</li> <li>• Labor</li> </ul>
Road Rangers Service Patrol	<ul style="list-style-type: none"> <li>• Incident response vehicle</li> <li>• Incident response labor (driver)</li> <li>• Communication line</li> </ul>	<ul style="list-style-type: none"> <li>• Video monitors/wall for incident detection</li> <li>• TMC incident response hardware/software</li> <li>• TMC system integration</li> <li>• TMC labor</li> <li>• Emergency management center hardware and software</li> <li>• Emergency response labor</li> <li>• Communication line</li> </ul>
Emergency Vehicle Preemption	<ul style="list-style-type: none"> <li>• Vehicle Hardware</li> </ul>	<ul style="list-style-type: none"> <li>• Intersection Hardware</li> </ul>
Transit Signal Priority	<ul style="list-style-type: none"> <li>• Signal Preemption Processor</li> <li>• Cell Based Communications Equipment</li> </ul>	<ul style="list-style-type: none"> <li>• Signal Preemption Receiver</li> <li>• Signal Controller Upgrade</li> <li>• Telecommunications (low usage)</li> </ul>
Automatic Vehicle Location System	<ul style="list-style-type: none"> <li>• Onboard equipment</li> </ul>	<ul style="list-style-type: none"> <li>• Central system</li> </ul>
TMC General Functions	<ul style="list-style-type: none"> <li>• TMC facility operations</li> <li>• TMC facility capital cost</li> <li>• Labor (supervisors, operators, general staff)</li> </ul>	<ul style="list-style-type: none"> <li>• Not Applicable</li> </ul>

**Table 2.3 Projects included in each Cost Category**

Cost Category	Included Project Types
Signalization Improvements	Fiber Interconnects/Communications, Signal Timing Studies, Coordinated Signal Control, Ramp Meters
Incident Management	Emergency Vehicle Preemption, CCTV Cameras, Road Rangers
Travel Time System	Dynamic Message Signs, 511 Automated Traveler Information Service
Transit Improvements	Transit Signal Priority, Automatic Vehicle Location system

**Figure 2.4 Summary of cost estimation process for TOPS-BC**

### 2.3.1 Distributed Costs and Geographic Scope

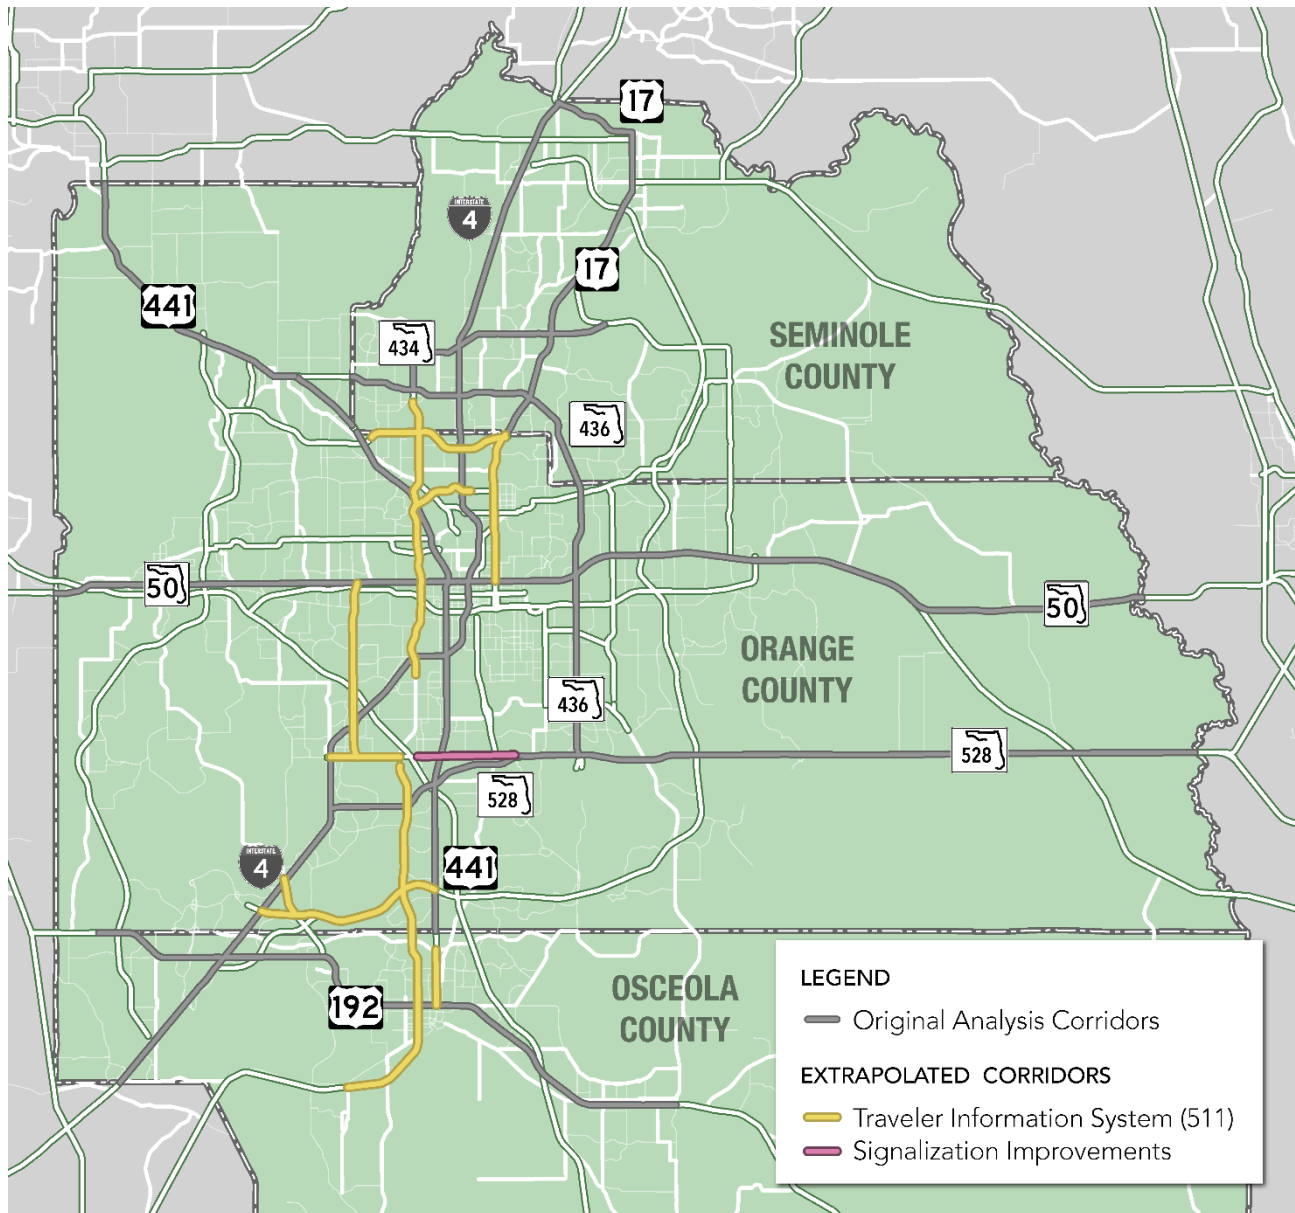

In pursuit of a balanced comparison of costs and benefits across the same cross-section of the ITS deployed in the Orlando Urban Area, this cost analysis only considers the ITS investments and strategies deployed on the eight corridors for which traffic data were available (see Figure 2.2). For costs that are widely distributed across the region, such as those for TMCs or centralized monitoring systems, the associated costs for those systems and items are scaled to reflect the fact that these eight corridors comprise only a fraction of the full coverage areas. Two notable exceptions to this approach for distributed system costs are noted below.

- Transit Strategies:** Because transit strategy benefits are evaluated across the full LYNX route network, the costs for AVL and TSP are calculated all vehicles and routes rather than just the subset that use the eight corridors shown in Figure 2.2.
- Emergency Vehicle Preemption:** As a result of input data limitations, the cost of equipping the vehicles of emergency responders will consider all responder vehicles in each county, rather than just the subset of those that routinely operate on the eight corridors being evaluated—a highly conservative assumption. This calculated total fleet size of responder vehicles will then be scaled according to the assumed deployment rate for EVP (refer to section B.3.1).

## 2.4 Off-Network Benefits and Costs

Additional benefits and costs associated with adaptive traffic control systems (ATCS) and traveler information systems are also known to be available on other routes in the Orlando Urban Area in addition to those shown in Figure 2.2. These additional routes are shown below in Figure 2.5.

**Figure 2.5. Off-Network Routes with Known ITS Investments**

However, due to a lack of available detailed contextual data for these other routes (e.g., detailed volume data, roadway data, ITS infrastructure/inventory data), they have not been included in the core analysis of benefits and costs. Instead, the supplemental benefits and costs associated with these extra routes are extrapolated from the core analysis results for the routes in Figure 2.2, based on average benefits per mile and average costs per mile for signalization improvements and traveler information systems. In the case of the extra corridors with Traveler Information System (511) investments shown in Figure 2.5, specific cost

data were available, and so they have been used in place of extrapolated costs from the core corridor analysis. These additional benefits and costs are then combined with the results of the core analysis to provide a more complete assessment of the value of ITS investment in the region.

## 3.0 Analysis Results

### 3.1 Benefits

The results of the benefit analysis are summarized in Table 3.1. To control for the fact that some jurisdictions are larger than others and/or have longer corridor extents, and would therefore be expected to have more substantial benefits than the shorter ones, Table 3.1 also reports the estimated benefits on a per-mile basis. A detailed breakdown of benefits by corridor is provided in Appendix D.

**Table 3.1 Annualized Benefits Summary by Category and Jurisdiction**

Benefit Category	Arterial Annual Benefit	Freeway Annual Benefit	Total Benefit	Per-Mile Benefit
<b>All Counties</b>				
Delay Savings Associated with Recurrent Congestion	\$787,086	\$0	\$787,086	\$4,991
Incident Management: Delay Savings	\$11,532,532	\$9,431,687	\$20,964,220	\$132,937
Incident Management: Crash Reduction Benefits	\$22,846,663	\$10,160,605	\$33,007,268	\$209,304
All Strategies: Fuel Savings	\$7,107,765	\$4,196,285	\$11,304,050	\$71,681
Transit Delay Savings	\$4,239,291	\$0	\$4,239,291	\$2,033
Total Benefits	\$46,513,337	\$23,788,577	\$70,301,914	\$420,947
<b>Orange County</b>				
Delay Savings Associated with Recurrent Congestion	\$495,702	\$0	\$495,702	\$5,324
Incident Management: Delay Savings	\$4,456,866	\$5,562,137	\$10,019,004	\$107,604
Incident Management: Crash Reduction Benefits	\$8,371,950	\$5,583,557	\$13,955,507	\$149,882
All Strategies: Fuel Savings	\$4,462,755	\$2,304,495	\$6,767,250	\$72,680
Transit Delay Savings	\$3,013,982	\$0	\$3,013,982	\$1,815
Total Benefits	\$20,801,255	\$13,450,189	\$34,251,444	\$337,304
<b>Seminole County</b>				
Delay Savings Associated with Recurrent Congestion	\$189,381	\$0	\$189,381	\$4,994
Incident Management: Delay Savings	\$6,845,658	\$3,412,247	\$10,257,905	\$270,514
Incident Management: Crash Reduction Benefits	\$8,199,575	\$3,706,585	\$11,906,160	\$313,981
All Strategies: Fuel Savings	\$1,699,372	\$1,531,418	\$3,230,790	\$85,200
Transit Delay Savings	\$689,775	\$0	\$689,775	\$4,058
Total Benefits	\$17,623,761	\$8,650,250	\$26,274,011	\$678,747

Benefit Category	Arterial Annual Benefit	Freeway Annual Benefit	Total Benefit	Per-Mile Benefit
<b>Osceola County</b>				
Delay Savings Associated with Recurrent Congestion	\$102,003	\$0	\$102,003	\$3,825
Incident Management: Delay Savings	\$230,009	\$457,303	\$687,312	\$25,771
Incident Management: Crash Reduction Benefits	\$6,275,138	\$870,463	\$7,145,601	\$267,927
All Strategies: Fuel Savings	\$945,638	\$360,372	\$1,306,010	\$48,969
Transit Delay Savings	\$535,534	\$0	\$535,534	\$2,108
Total Benefits	\$8,088,322	\$1,688,138	\$9,776,460	\$348,600

Based on the total benefits reported for each corridor in Table 3.1, the overall annual monetized benefit associated with ITS investments in the Orlando Urban Area is \$70.3 million, or \$421k per mile. Of this, approximately \$21.8 million (or 31% of the total) is a result of delay savings, \$33.0 million (47%) is a result of crash-related savings (damage and injury costs), \$11.3 million (16%) is a result of annual fuel savings, and \$4.2 million (6%) is captured by bus passengers through the transit strategies. The delay savings category includes the combined benefits for:

- Traveler information strategies associated with recurrent congestion, and
- Incident management strategies associated with non-recurrent congestion.

## 3.2 Costs

Annualized costs for each ITS category are summarized by jurisdiction in Table 3.1, with detailed results by corridor provided in the appendix. TMC costs have been split among the different cost categories according to the distribution of all other costs among these categories.

**Table 3.2 Annualized Cost Summary by Category and Jurisdiction**

Cost Category	Arterial Annual Cost	Freeway Annual Cost	Total Annual Cost	Per-Mile Annual Cost
<b>All Counties</b>				
Signal Improvements	\$5,288,471	\$1,815,550	\$7,104,021	\$45,048
Incident Management	\$847,734	\$1,966,894	\$2,814,628	\$17,848
Travel Time System	\$904,596	\$398,392	\$1,302,989	\$8,262
Transit Strategies	\$2,531,136	\$0	\$2,531,136	\$1,214
Total Annualized Cost	\$9,571,937	\$4,180,836	\$13,752,773	\$72,372

Cost Category	Arterial Annual Cost	Freeway Annual Cost	Total Annual Cost	Per-Mile Annual Cost
<b>Orange County</b>				
Signal Improvements	\$2,949,153	\$1,373,909	\$4,323,061	\$46,430
Incident Management	\$349,200	\$998,592	\$1,347,793	\$14,475
Travel Time System	\$578,040	\$212,805	\$790,845	\$8,494
Transit Strategies	\$1,982,119	\$0	\$1,982,119	\$1,193
Total Annualized Cost	\$5,858,512	\$2,585,306	\$8,443,818	\$70,592
<b>Seminole County</b>				
Signal Improvements	\$1,606,324	\$441,641	\$2,047,966	\$54,008
Incident Management	\$335,987	\$649,841	\$985,828	\$25,998
Travel Time System	\$263,351	\$161,412	\$424,763	\$11,202
Transit Strategies	\$254,562	\$0	\$254,562	\$1,497
Total Annualized Cost	\$2,460,224	\$1,252,894	\$3,713,119	\$92,704
<b>Osceola County</b>				
Signal Improvements	\$732,994	\$0	\$732,994	\$27,484
Incident Management	\$162,547	\$318,460	\$481,007	\$18,036
Travel Time System	\$63,206	\$24,175	\$87,381	\$3,276
Transit Strategies	\$294,455	\$0	\$294,455	\$1,159
Total Annualized Cost	\$1,253,201	\$342,635	\$1,595,837	\$49,955

Based on the total annual costs indicated for each corridor in Table 3.2, the overall annual cost associated with ITS investments in the Orlando Urban Area is \$13.8 million, or \$72k per mile. Of these costs, approximately \$7.1 million (or 52% of the total) is associated with signalization improvements, \$2.8 million (20%) is related to incident management, \$1.3 million (10%) is attributed to travel time information systems, and \$2.5 million (18%) is invested in transit improvements.

### 3.3 Benefit-Cost Ratios

Merging the cost and benefit analyses provides greater insight into the economic performance and value of the ITS investments in the Orlando Urban Area. Specifically, given an annual benefit of approximately \$70.3 million to the traveling public across all corridors and jurisdictions, combined with a corresponding annual cost of \$13.8 million specifically for the strategies analyzed, this indicates an overall benefit-cost ratio of 5.11 to 1. Put another way, every \$1.00 invested in ITS in the Orlando Urban Area generates more than \$5.11 in benefits for users of those facilities. Alternatively, a decision not to fund these strategies could be expected to result in a net loss to the public of \$56.5 million annually.

Figure 3.1, Figure 3.2, Figure 3.3, and Figure 3.4 summarize the overall benefit/cost analysis results by improvement category/type. When interpreting these results, it is important to recognize that benefits are only fully achieved when all parts of the system are effectively engaged together, rather than operated in isolation. The results of the benefit/cost analysis show that the benefits obtained from the system are generally concentrated on the more congested segments, which is expected given that delay reductions and

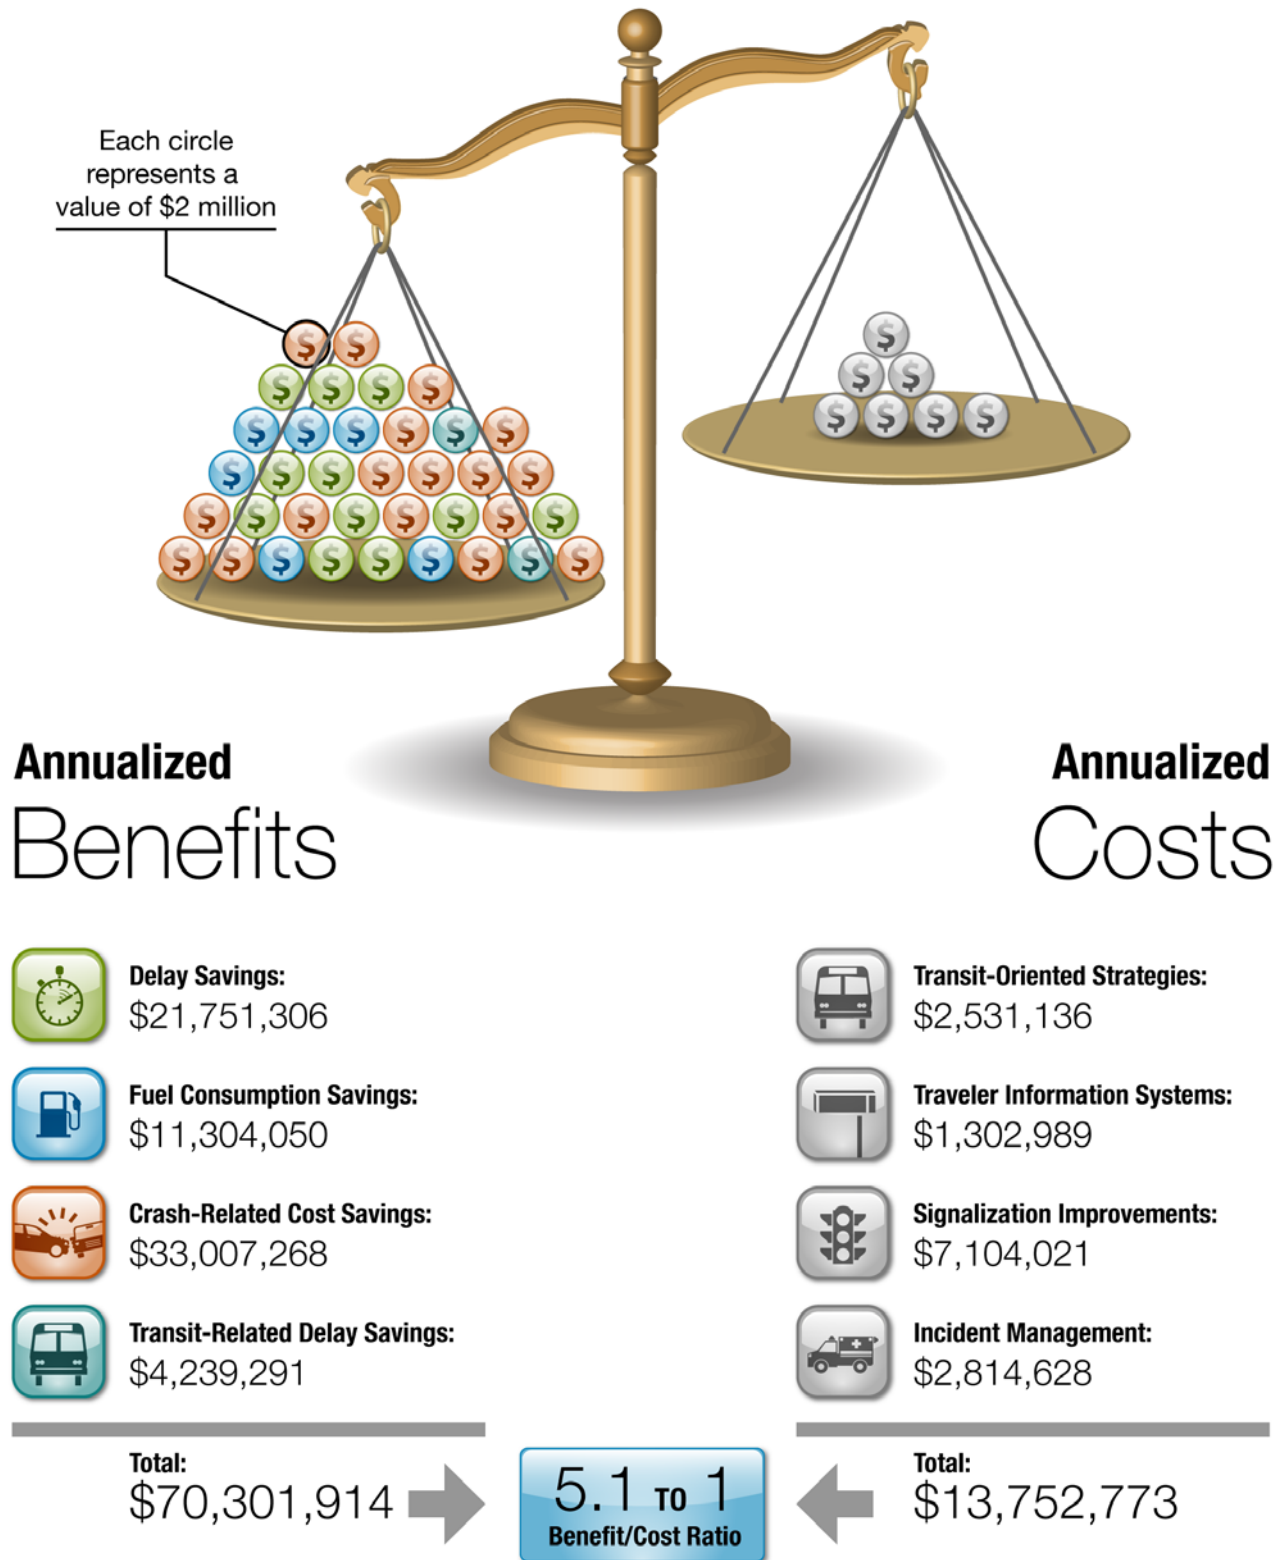

other benefits cannot occur on a segment that has no performance issues to begin with. This also suggests that as congestion inevitably continues to grow in the future, the benefits of these ITS investments will increase as long as steady investment in the system continues.

Benefit-cost ratios are provided in Table 3.3 separately for arterials and freeways in each jurisdiction, where transit strategies are included in the arterial category.

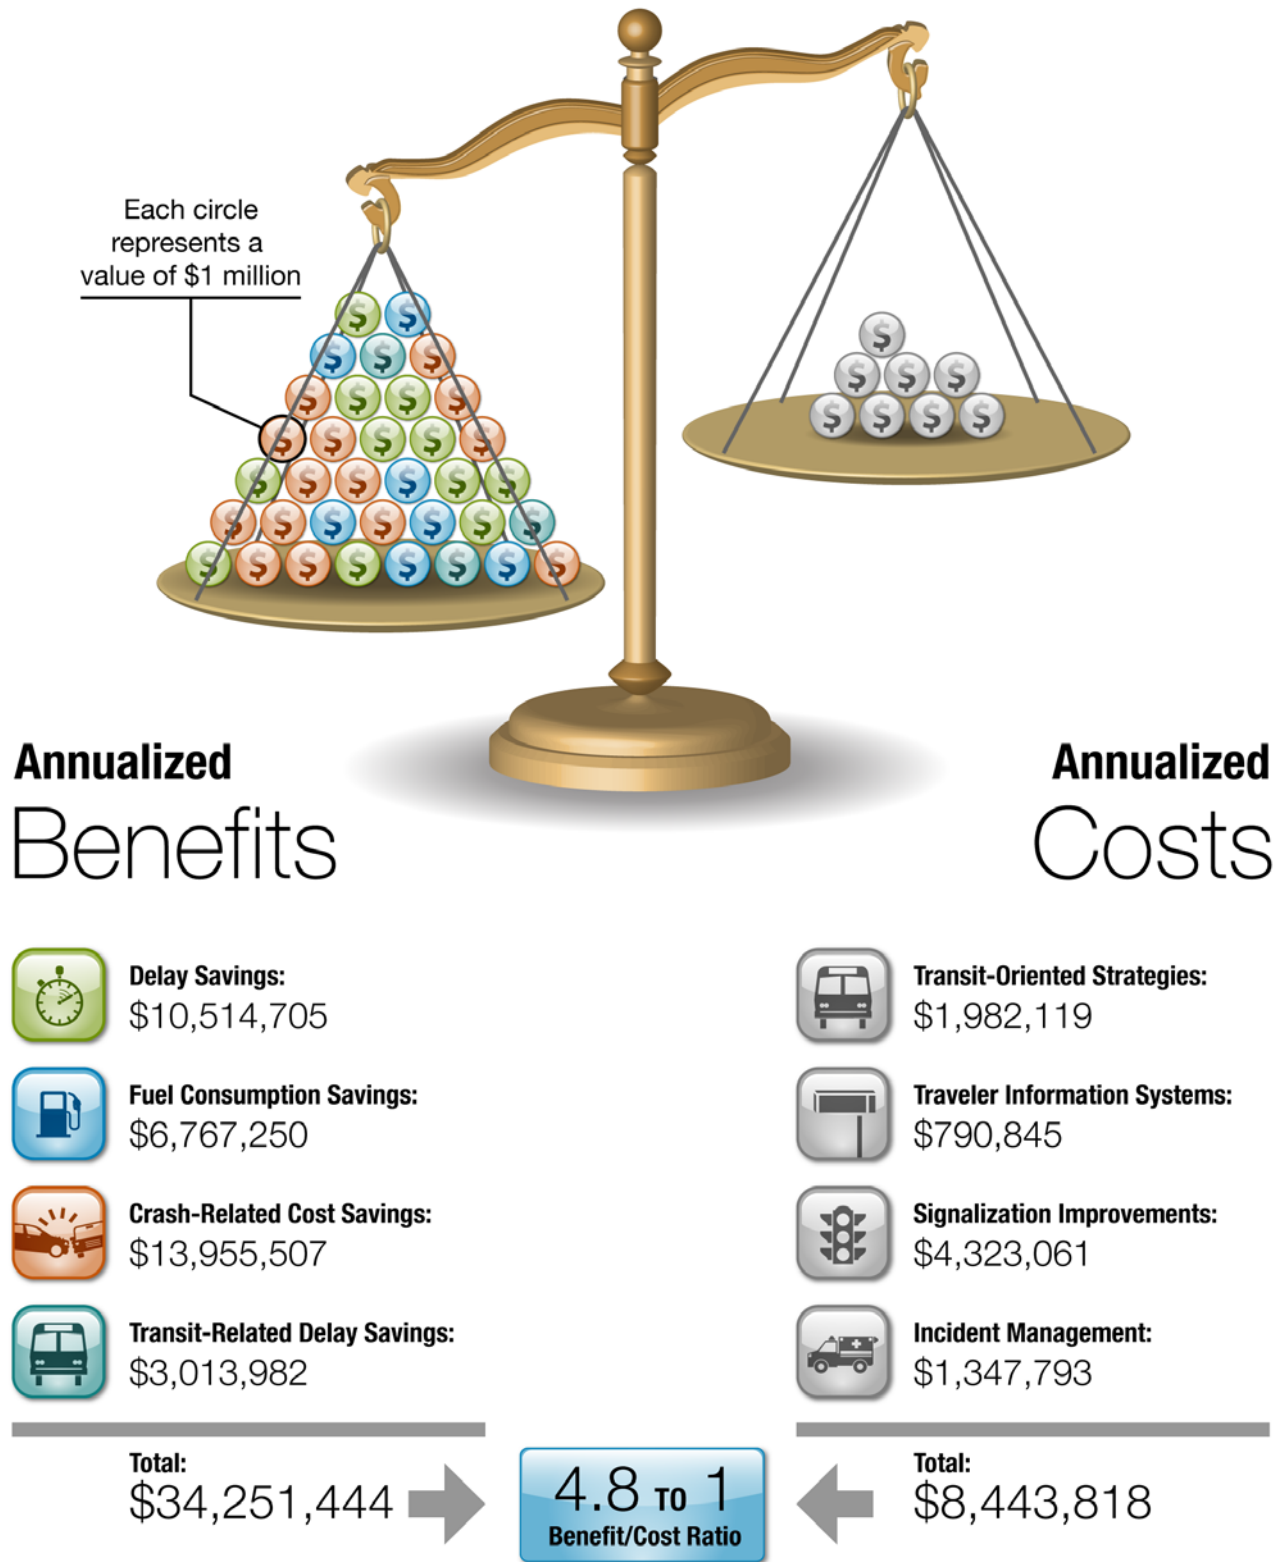

**Table 3.3 Benefits and Costs by Roadway Type and Jurisdiction**

Benefit Category	Annual Benefit	Annual Cost	Benefit-Cost Ratio
<b>All Counties</b>			
Arterials	\$46,513,337	\$9,571,937	4.86 to 1
Freeways	\$23,788,577	\$4,180,836	5.69 to 1
<b>Orange County</b>			
Arterials	\$20,801,255	\$5,858,512	3.55 to 1
Freeways	\$13,450,189	\$2,585,306	5.2 to 1
<b>Seminole County</b>			
Arterials	\$17,623,761	\$2,460,224	7.16 to 1
Freeways	\$8,650,250	\$1,252,894	6.9 to 1
<b>Osceola County</b>			
Arterials	\$8,088,322	\$1,253,201	6.45 to 1
Freeways	\$1,688,138	\$342,635	4.93 to 1

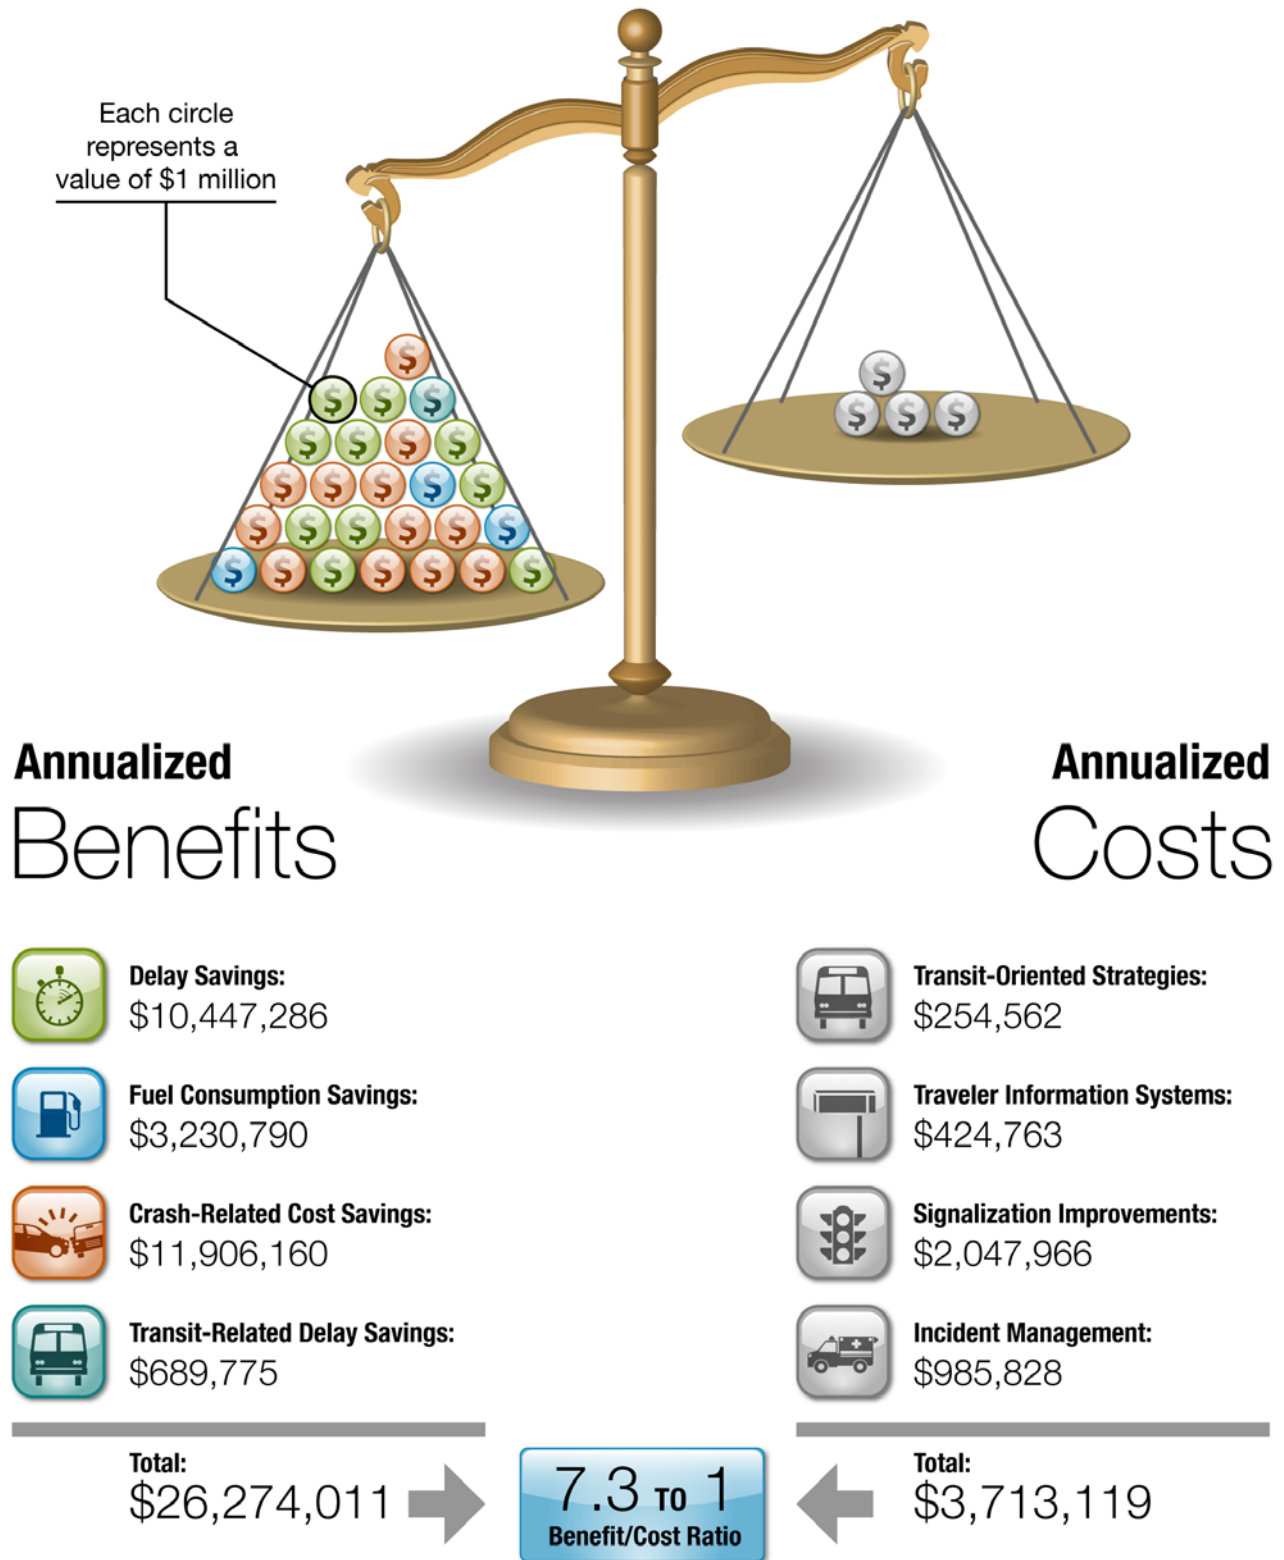

**Figure 3.1 Summary of Benefit-Cost Analysis results for All Counties**

**Figure 3.2 Summary of Benefit-Cost Analysis Results for Orange County**

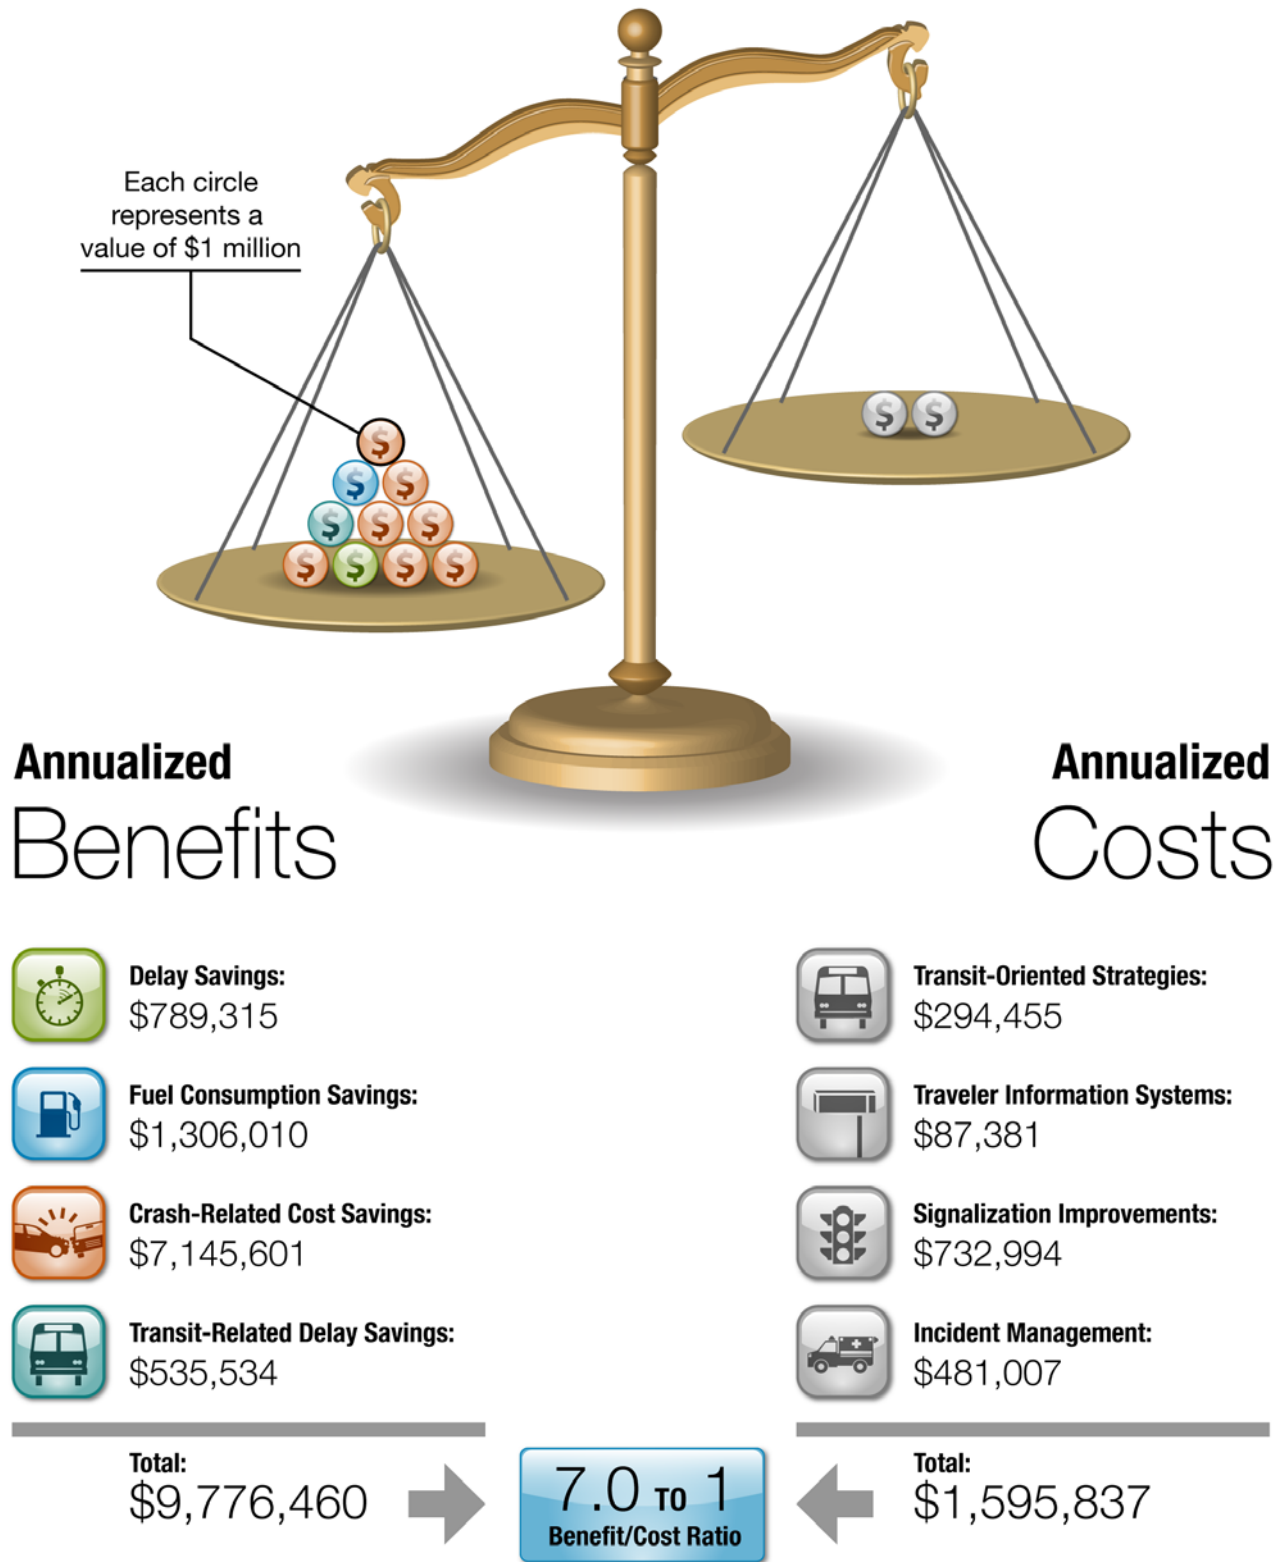

**Figure 3.3 Summary of Benefit-Cost Analysis Results for Seminole County**

**Figure 3.4 Summary of Benefit-Cost Analysis Results for Osceola County**

## 4.0 Sensitivity Analysis

To examine the effects of uncertainty associated with key assumptions made as part of this benefit/cost analysis, the calculations of Chapter 3 have been repeated using several alternate sets of parameters, with the subsequent results for each of those alternatives presented here as part of a benefit-cost sensitivity analysis. Six analysis alternatives (plus the baseline scenario) were examined altogether, as summarized in Table 4.1.

**Table 4.1 Scenarios Examined as Part of the Sensitivity Analysis**

Sensitivity Analysis Scenario	Description
Baseline Analysis	Uses all analysis assumptions and parameter values as described previously.
Signalization Improvements	Capacity-related gains associated with signalization improvements reduced by 20% (i.e., 8% instead of 10%).
Incident Management	Crash rate benefits associated with incident management strategies reduced by 20% (i.e., 8% instead of 10%).
Travel Time System Breadth	Amount of time that useful information is disseminated by travel time systems is reduced by 20% (i.e., 16% instead of 20%).
Travel Time System Effectiveness	Travel time savings provided by travel time systems is reduced by 20% (i.e., 4 minutes instead of 5 minutes).
Value of Time	Value of time reduced by 20% across all vehicle classes.
Fuel Costs	Fuel costs reduced by 20% across all vehicle classes.

The results of the sensitivity analyses are summarized by jurisdiction in Table 4.2. It is important to note that the sensitivity analyses have been performed for the core analysis network only (i.e., the corridors in Figure 2.2), and do not also include the supplemental benefit and cost calculations associated with the extra routes (i.e., those shown in Figure 2.5). As the overall purpose of the sensitivity analysis scenarios is to evaluate the relative impacts of various changes to the input assumptions, and given that the supplemental benefit and cost calculations are largely extrapolations of the core analysis results, it is not necessary to include the supplemental benefit and cost estimates in these scenarios.

In each case, the first alternative represents the cost/benefit analysis with the standard assumptions described in Chapter 2, and therefore functions as the baseline against which all other scenarios are compared. The table also indicates the percentage drop in total benefits relative to the baseline scenario, and an updated benefit/cost ratio. A detailed breakdown of scenario results by corridor is provided in Appendix D.

**Table 4.2 Summary of Annualized Costs and Benefits for each Sensitivity Analysis Scenario**

Sensitivity Analysis	Total Annual Benefits*	Reduction in Annual Benefit	Total Annual Cost*	Benefit-Cost Ratio*
<b>All Counties Combined</b>				
Baseline Analysis	\$68,890,967	N/A	\$13,216,618	5.2 to 1

Sensitivity Analysis	Total Annual Benefits*	Reduction in Annual Benefit	Total Annual Cost*	Benefit-Cost Ratio*
Signalization Improvements	\$68,727,604	0%	\$13,216,618	5.2 to 1

Fuel Costs	\$9,335,642	3%	\$1,532,631	6.1 to 1

\*Excludes supplemental results associated with off-network extrapolated benefits and costs.

## 4.1 Interpretation of Results

With respect to the six sensitivity analyses performed and presented in this chapter, none of the scenarios resulted in a decrease in benefits of more than 10% on overall benefits for ITS strategies in the Orlando Urban Area, with most having an impact of 5% or less. Even in the Incident Management sensitivity analysis scenario, which had the largest impact on benefits overall, the net annual gain across all ITS strategies was

\$49.7 million, yielding a benefit/cost ratio in excess of 4:1. This shows a resilience of the findings with respect to the benefits and value of ITS in the MetroPlan region, even when subjected to levels of uncertainty associated with the precise levels of benefit associated with any one given type of strategy.

Each scenario in this analysis is intended to be compared to the baseline results shown in the first row of Table 4.2. This is by design, as the primary objective of this sensitivity analysis was to provide insight into the extent to which the results of this benefit analysis depend on the specific input parameters that were selected. In all of the scenarios examined, a double-digit percent change in the input parameters resulted in only a single-digit percent change in the estimated level of overall benefit across the counties, showing that the results are relatively stable and not highly influenced by the parameter values that have been used.

Looking at the impacts between individual counties, Orange County exhibited a relatively high sensitivity to the adjustments of the Fuel Costs scenario compared to the other counties, while showing relatively low sensitivity to the adjustments of the Incident Management Scenario. This is as expected, given that fuel savings constitute a larger proportion of the overall benefits for Orange County than they do for either of the other two counties, while incident-related delay and crash savings constitute a relatively small portion compared to the other two counties (see Table D.3).

Similarly, Seminole County exhibited a relatively low sensitivity to the Fuel Costs scenario, which again reflects the fact that fuel costs comprise a relatively small proportion of the overall benefits to Seminole County, compared to Osceola and Orange Counties (see Table D.3). However, Seminole County also shows a relatively high sensitivity to the two travel time scenarios, which may be explained by the relatively high level of coverage for that strategy in Seminole County compared to the other two counties (see Table B.3).

Finally, Osceola County exhibits a relatively high sensitivity to the incident management scenario and a relatively low sensitivity to the travel time scenario. This high sensitivity to the incident management impact factors may be explained by the fact that Osceola County's crash-related benefit (which is the benefit category that is most directly connected to crash rate) constitutes 74% of its total benefits (see Table D.3), whereas this percentage is far lower for the other two counties (i.e., 42% and 45%). The low sensitivity to the travel time scenario in Osceola County may be explained by the low coverage rate of travel time information systems in Osceola County compared to the other two (see Table B.3), which corresponds to a relatively low contribution of that strategy type to the overall benefits in that county.

## 5.0 Conclusions and Next Steps

This business case analysis used a nationally recognized benefit/cost estimation tool from FHWA, informed by years of research projects and empirical data from leading studies across the country, and applied it to detailed ITS inventory/deployment data and traffic/roadway configuration data from the Orlando Urban Area to obtain reliable estimates of overall ITS-related benefits and costs throughout the region and by county. Impact parameters were tailored to each of the 326 analysis segments according to their specific characteristics, and benefits for each segment were estimated using high-fidelity hourly volume data to achieve the highest level of analysis precision possible.

Across all counties and all analysis scenarios, the ITS strategies deployed in the Orlando Urban Area consistently demonstrated a significant value across several categories, including fuel savings, time/delay savings, crash injury/damage cost savings, and improved transit performance/efficiency. The analysis revealed a regionwide annual benefit of \$70.3 million against a cost of \$13.8 million, for a benefit-cost ratio of 5.1 to 1.

The benefits were well distributed across the region, with all three counties shown to benefit substantially from their respective ITS investments across these categories. Specifically, Orange County benefits the most from ITS strategies in terms of absolute dollar amounts, with a countywide benefit of \$34.3 million annually compared to \$26.3 million for Seminole County and \$9.8 million for Osceola County. Normalizing these benefits by mileage, Seminole County exhibits the highest dollar value of annual benefits per mile at \$678k, compared to \$337k per mile in Orange County and \$349k per mile in Osceola County. From a cost perspective, Osceola was the most efficient with an estimated per-mile rate of \$50k for all ITS strategies combined, compared to \$71k per mile in Orange County and \$93k per mile in Seminole County. Bringing together the benefit and cost results by county, the benefit-cost ratio is found to be highest for Seminole County at 7.3 to 1, compared to 7.0 to 1 for Osceola County and 4.8 to 1 for Orange County.

These findings were found to be resilient even when subjected to double-digit levels of uncertainty regarding the input parameters used to produce these results, as demonstrated by the outcomes of the sensitivity analysis scenarios. Across a set of six scenarios designed to examine the effects of reasonable ranges of uncertainty associated with several key analysis parameters, the net benefit was always at least \$49 million per year, resulting in benefit-cost ratios well in excess of 4:1 in all cases.

### 5.1 Near-Term ITS Opportunities

Moving forward, there are a number of emerging ITS technology trends that MetroPlan can be expected to benefit from in the near term. These will impact TSMO functions and operations in a number of ways, and include:

- Performance-based planning and management
- Advanced traffic management
- Integrated corridor management
- Emerging vehicle technologies, including zero-emissions vehicles
- Changing roles of transportation data

- Changing roles of traveler information
- Finance and payment options
- Connected and automated vehicle opportunities

More information about each of these items is available in a separate technical memo, *Next Steps for the MetroPlan Orlando ITS Master Plan*.

## Appendix A. Inventory Data and Other Analysis Inputs

This chapter contains the input data and reference information required to support the benefit and cost calculations of this analysis. These include:

- Roadway configuration data (i.e., number of lanes, free flow speed, analysis segment lengths)
- Traffic data (i.e., volume data)
- ITS equipment inventory data by corridor
- Emergency Vehicle fleet size estimates
- Transit network and fleet size data

### A.1 Roadway Configuration Data

High-level roadway characteristics for the analysis segments are summarized in Table A.1. Detailed roadway characteristics and traffic characteristics by segment are provided in the next section.

**Table A.1 Roadway Characteristics by Corridor and Jurisdiction**

Characteristic	Corridor							
	A	B	C	D	E	F	G	H
<b>All Counties</b>								
Length (miles)	37.07	44.98	35.75	16.93	22.64	9.40	26.67	46.69
Analysis segment type (F = Freeway, A = Arterial)	A	A	F	A	A	A	A	F
Number of major junctions	9	6	4	7	6	3	6	14
<b>Orange County</b>								
Length (miles)	37.07	44.98	35.75	—	11.06	—	—	24.67
Analysis segment type (F = Freeway, A = Arterial)	A	A	F	—	A	—	—	F
Number of major junctions	9	6	4	—	3	—	—	7
<b>Seminole County</b>								
Length (miles)	—	—	—	16.93	11.59	9.40	—	14.14
Analysis segment type (F = Freeway, A = Arterial)	—	—	—	A	A	A	—	F
Number of major junctions	—	—	—	7	3	3	—	5
<b>Osceola County</b>								
Length (miles)	—	—	—	—	—	—	26.67	7.89
Analysis segment type (F = Freeway, A = Arterial)	—	—	—	—	—	—	A	F
Number of major junctions	—	—	—	—	—	—	6	2

A dash (—) indicates that a segment was not analyzed in that county due to various factors, including lack of available data.

## A.2 Traffic Characteristics

Table A.2 through Table A.25 provide hourly estimates for traffic volumes at various mileposts along each of the eight analysis corridors, along with basic configuration data for each of the corresponding segments. The lane counts used for each analysis segment are based on the lane count measured at the segment midpoint, and are obtained from FDOT GIS files.<sup>4</sup> Free-flow speeds have been calculated analogously, using a different set of FDOT GIS files.<sup>5</sup>

Most data locations along the eight corridors had only daily volume estimates available. To separate these AADT data provided at most measurement locations into hourly counts, typical daily traffic distributions were estimated using hourly data from all available locations along each corridor that already had data disaggregated at this level. If no locations along a particular corridor had hourly data available, the nearest hourly data source on an adjacent parallel corridor was used instead (note that this is simply to establish the relative volume distribution throughout the day).

### A.3 Equipment Inventory Data

For proper cost estimation and benefit impact evaluation, the number of deployed ITS elements in the field must be established. As described in the previous chapter, only equipment deployed along the eight analysis corridors are considered in this cost analysis, to ensure a proper benefit-cost comparison is performed (see Figure 2.2). The exception to this is the transit component of the benefit-cost analysis, which considers the full system deployment with respect to transit strategies (see Table 2.3).

Table A.26 summarizes the ITS field equipment deployed along the eight analysis corridors by county, as estimated using the inventory tables and maps presented at the first project workshop.<sup>6</sup> Signal inventory data were not available for Osceola County, and so have been estimated based on the average number of signalized intersections per mile across all other counties (2.2 intersections per mile).

A dash (—) indicates that a segment does not exist in the given jurisdiction.

\* FSP does not apply to arterial corridors. Signals do not apply to freeway corridors.

\*\* This represents only 48% of the full extent of this retiming project (and is therefore assumed to cost only 48% of the full retiming project cost). The remaining 52% occurred beyond the limits of this analysis corridor.

\*\*\* These Road Rangers are shared across all three counties.

For cost purposes, Fiber is assumed to be installed separately for each freeway direction over the lengths shown in Table A.26 (effectively doubling the Fiber mileage and cost for freeway corridors while leaving the coverage extents unaffected). Conversely, both directions of an arterial are assumed to be served by a single Fiber communications line.

## A.4 Emergency Responder Data

For the estimation of costs associated with Emergency Vehicle Preemption, it is necessary to have an estimate of the number of responder vehicles that are equipped with the required technology. Using a combination of population statistics and typical per-capita rates of emergency responder vehicles and personnel, these estimates can be calculated.

The following typical rate ranges are obtained from available literature:

- **Fire Department.** There are 0.13-1.09 fire department engines per 10,000 residents based on data from agencies across the U.S..<sup>7</sup> As a conservative assumption, this analysis will assume 1 engine per 10,000 residents.

<sup>7</sup> Thomson, K. *U.S. Fire Department Staffing and Resource Allocation Survey*. UFOA. Spring 2011. <http://www.ufoa.org/researchfiles/file00000009.pdf> (accessed 10-21-2016)

- **Police Department.** The average number of police officers per 100,000 population is 201.2. Furthermore, approximately 66% of officers are assigned to patrol duties, and may be expected to have patrol vehicles available.<sup>8</sup>
- **Ambulances and EMS Personnel.** For midsize cities, there is an average of one ambulance per 51,223 people.<sup>9</sup>

To apply these rates, the following population data from the U.S. Census Bureau for Orange, Seminole, and Osceola Counties will be used. These data are from 2013, as this was the most recent year of data available from the Bureau.

- **Orange County:** Estimated population of 1.225 million.
- **Seminole County:** Estimated population of 436,041.
- **Osceola County:** Estimated population of 298,504.

The resulting estimates for the number of emergency responder vehicles in each county are provided in Table A.27.

**Table A.27 Calculated Quantities for Transit Ridership on LYNX**

Quantity	Orange County	Seminole County	Osceola County	All Counties
Annual Ridership <sup>10</sup>	4,534,088 (72%)	779,116 (12%)	1,001,988 (16%)	6,315,192
Passenger-miles Traveled Annually	95,711,617	16,446,627	21,151,308	133,309,552
Directional route-miles <sup>11</sup>	1,661	170	254	2,085
Number of known intersections by routes and direction <sup>12</sup>	4,893	781	501	6,175
Number of unique known intersections, merging across routes and directions <sup>12</sup>	1,292	241	175	1,708
Signals per mile along LYNX directional routes	2.95	4.59	1.97	
Signals traversed annually for each passenger	281,948,792	75,557,738	41,719,706	399,226,236

## A.5 Transit Data

Inventory data related to the LYNX transit network and fleet are provided in Table A.28. These have been calculated according to the following reference data and assumptions.

- The overall number of annual passenger-miles traveled is: 133,309,552.<sup>13</sup>
- The overall deployment of TSP in the Orlando Urban Area is 6 out of 16 agencies, or roughly 37.5% deployed. This is assumed to represent both the fraction of vehicles that are equipped with TSP transponders, and the fraction of intersections that are equipped with TSP receivers.
- The total fleet size is 300 vehicles.<sup>14</sup>

The procedures used to calculate the quantities of Table A.28 that were not directly referenced to available sources are:

- **Passenger-Miles Traveled Annually:** Using the LYNX ridership percentages by county, the total passenger-miles traveled on transit in each county are estimated by splitting the total passenger-miles traveled annually on LYNX according to these percentages.
- **Signals Per Mile along LYNX Directional Routes:** The average number of signalized intersections encountered per mile is calculated by dividing the total directional route mileage in a jurisdiction by the total number of signalized intersections by route/direction in that jurisdiction. Note that this count of signalized intersections considers the number along each directional route, such that an intersection traversed by multiple routes is counted multiple times. In 3% of all cases, the exact number of routes passing through that intersection was not available. For these intersections, a conservative value of 2 was assumed, based on the expectation that at least one route would pass through this intersection in both directions.
- **Signals Traversed Annually for Each Passenger:** The number of TSP-equipped signals traversed across all passengers is calculated as the product of the total passenger VMT and the average number of signals per mile.

## Appendix B. Benefit Analysis Methodology and Details

This appendix expands upon the methodology overview provided in Chapter 2.0 by describing the detailed procedures, assumptions, and inputs that have been used to generate the estimated benefits by jurisdiction and outcome category as presented in Chapter 3.0. The specific topics included in this appendix include:

- Background information on the different categories of estimated benefits and their mechanisms.
- TOPS-BC specifications and analysis assumptions.
- Procedures, assumptions, and calculation results regarding the extent of ITS strategy coverage for each analysis corridor.
- Procedures, assumptions, and calculation results regarding the TOPS-BC benefit impact factors associated with each analysis corridor.
- Transit-specific analysis procedures, assumptions, and calculation results regarding the time savings associated with transit signal priority and automated vehicle location information.
- Monetization parameters used to convert all estimated benefits into dollar equivalents, to facilitate comparisons across categories and corridors, and to enable comparisons of benefits and costs.

### B.1 Background

Benefits resulting from ITS strategies generally fall into the following categories:

- **Mobility.** Detection and surveillance technologies allow faster identification of, response to, and clearance of incidents, leading to reduced traffic delays. In addition, traveler information services provide motorists with alerts regarding unanticipated congestion in advance, giving them time to take appropriate measures such as rerouting, switching modes, or deferring trips. Efficient operation of arterial signals and other traffic control devices help to improve both travel times and reliability, enabling motorists to reduce the extra “buffer” time they typically build into their trips to ensure on-time arrival. Benefits associated with improvements in travel time reliability are particularly significant in areas with highly variable congestion severity from one day to another, which is commonly associated with areas where congestion itself is a regular occurrence, as it is these segments that are most significantly impacted by even minor disturbances (e.g., traffic incidents).
- **Safety.** The principal contribution of ITS in traffic safety is targeted toward reducing secondary traffic collisions, which are incidents that occur as a result of other earlier precipitating (primary) incidents. Such secondary incidents become increasingly likely as the duration of the primary incident increases, so that improvements in incident clearance times accomplished through ITS have a positive effect on secondary crashes. Another common ITS method for addressing crashes is to provide advanced warnings to motorists of upcoming congestion.
- **Fuel Consumption and Air Quality.** Many ITS strategies improve fuel consumption and air quality by addressing traffic delays, stop-and-go driving, and extended vehicle idling: traveler information dissemination systems help divert traffic when more efficient routes or modes are available, and incident management strategies reduce the delays associated with traffic collisions.

By monetizing the estimated benefits (i.e., converting each of the benefit quantities into equivalent dollar amounts), the outcomes associated with each category can be aggregated and appropriately compared in a meaningful way. TOPS-BC provides quick, reliable methods for estimating the mobility, safety, and fuel consumption impacts of various transportation improvements, and includes integrated benefit monetization functionality as well.

## B.2 TOPS-BC Specifications, Functionality, and Limitations

For this benefit analysis, the Traffic Incident Management module of TOPS-BC Version 1.2 was used, as it was the one with all necessary input parameter options for each strategy. For each arterial segment, the facility type specified in TOPS-BC was “Principal Arterial.” For each freeway segment, the facility type specified in TOPS-BC was “Urban Freeway.” As the minimum allowable analysis duration in TOPS-BC is one hour, the benefit analysis was performed separately for each hour of the day to provide the maximum possible temporal resolution of the estimated benefits.

Although TOPS-BC provides for benefits estimates with respect to travel time savings, crash reductions, and fuel savings, the latest version currently has no air quality assessment capabilities, and so these benefits are not captured in the current analysis. However, while air quality is closely linked to public health impacts, existing literature has shown that the monetized benefits associated with improved air quality are comparable to those obtained from fuel consumption analyses. As TOPS-BC is a quantitative impact assessment tool, it does not report qualitative or intangible benefits associated with ITS, such as improved customer service or reduced driver stress. Although these outcomes are beyond the scope of the current analysis, they may be evaluated in future work using alternative tools, such as user surveys that employ self-reported categorical or qualitative responses (e.g., “high impact,” “strongly agree,” or “very important”).

It should also be noted that there are additional indirect benefits that are often challenging to separate out from the impacts of any number of other confounding variables without detailed modeling/analysis methods, and are consequently out of scope for the current analysis as well.

- **Operational Savings.** ITS infrastructure can reduce operating costs for public agencies in several ways, including faster response times, automation of incident detection and data collection, and improved transit on-time performance. Remote monitoring of facilities also reduces staffing burden, and data archives allow for improved performance monitoring, more informed decision-making, and data-driven long term planning.
- **Economic Benefits.** While the direct impacts associated with ITS and accompanying delay savings are captured in the form of time savings, there are many other indirect economic benefits afforded by such improvements as well. For example, a more efficient transportation system reduces shipping costs, improves scheduling reliability, and enables businesses to reduce the buffer time they build into their production schedules.

To ensure a tractable analysis methodology, several conservative assumptions and simplifications have been made that may result in additional modesty in the reporting of benefits for the ITS in the Orlando Urban Area:

- Benefits are assumed to occur on 250 working days of the year only, meaning that the ITS benefits on Saturdays (which have been subject to increasing levels of congestion that are, in some cases,

comparable to weekday traffic patterns) are not being captured. In contrast, costs are calculated over the full year.

- Reductions in emissions and the associated health benefits are not being considered. As discussed earlier, this is a limitation of the current version of TOPS-BC, which does not provide estimates for emissions reductions.
- Other indirect and secondary benefits associated with the ITS system are largely unaccounted for by the TOPS-BC analysis. These include:
  - Operational savings as discussed earlier in this section.
  - Economic benefits as discussed earlier in this section.
  - Local agencies, private traffic information distributors, and web site visitors who use the CCTV real-time camera image feeds (if made available to partner agencies).
  - The utilization of changeable message signs for public safety and information announcements.

### B.3 ITS Coverage by Analysis Segment

To more accurately calculate the anticipated level of benefit associated with the ITS strategies on each corridor, a corresponding “percent coverage” is calculated for each corridor to reflect the extent to which a particular project category is deployed/available on it. Transit-oriented strategies are discussed separately in a later section of this chapter.

#### B.3.1 Assumptions

The following global assumptions have been made for this MetroPlan ITS Benefit-cost analysis and are reflected in the table.

- A total of 12 Road Rangers Service Patrol trucks are deployed across the I-4 freeway corridor.<sup>18</sup>
- Emergency vehicle preemption is available at 43% of signals throughout the Orlando Urban Area and is supported by 43% of emergency vehicles in the region, based on a reported 7 equipped agencies out of 16.<sup>19</sup> This results in an overall assumed EVP availability of 18%, or the overall probability that an EVP-equipped vehicle (43%) encounters an EVP-equipped intersection (43%).
- Travel time data sources are available on all SunGuide routes only (i.e., all corridors except US 192), and provide useful travel time data for traveler information systems on all corridors.
- As no DMS and CCTV inventory data were available for the City of Orlando, the coverage rates for the remaining portions of Orange County were assumed to apply within the Orlando city limits as well.

<sup>18</sup> MetroPlan Orlando. *Tracking the Trends*, June 2016. p26.

<sup>19</sup> MetroPlan Orlando ITS Master Plan Workshop #1 Presentation Slides, April 29, 2016. Slide 41.

### B.3.2 Calculation Procedure

Table B.1 describes the methodology for calculating the percent coverage for each ITS project type on a segment. To translate the project coverage by ITS strategy into a format that can be input into TOPS-BC, the coverage by ITS type (i.e., Table B.1) must be consolidated into four broader TOPS-BC improvement categories according to the mapping provided in Table 2.1.

**Table B.1 Methodology for Calculating Percent Coverage of each ITS Type on a Given Corridor**

ITS Project Type	Coverage Calculation Method
CCTV	The number of CCTV units along the corridor is counted. Each unit is assumed to have coverage of ½ mile in either direction, for a total coverage of 1 mile per camera. Each camera is furthermore assumed to have minimal coverage overlap with adjacent cameras. Therefore, the total number of cameras on the corridor is multiplied by one mile per camera, to obtain a total corridor coverage rating for CCTV. This is then converted into a percent coverage by dividing by the total mileage of the corridor. Coverage is capped at 100% in the event that a given corridor has a large quantity of CCTV units, resulting in a calculated value of over 100% coverage.
Signal Coordination	Percent of computer-controlled coordinated traffic signals in the jurisdiction. <sup>20</sup>
Signal Retiming	Length of corridor that was retimed, divided by the total length of the corridor. <sup>21</sup>
Road Rangers Service Patrol	Assumed to provide full coverage of I-4 freeway corridor only.
Emergency Vehicle Preemption (EVP)	Assumed to have an overall coverage of 18%, based on the assumption that 43% of all agencies have EVP-equipped vehicles, and 43% of all signals are EVP-capable. In this case, the overall coverage value of 18% is based on the probability of an EVP-equipped signal and an EVP-equipped vehicle occurring simultaneously, or the product of 43% and 43%.
On-road Traveler Information System	Number of junctions with State Roads (i.e., major decision points) along the corridor that have dynamic message signs in advance, divided by the total number of major junctions along the corridor. This coverage calculated separately by direction. DMS directions are assumed based on positioning relative to major junctions.
511 Traveler Information System	Assumed to be available on all SunGuide routes only (i.e., all corridors except US 192).
Freeway Ramp Metering	Not present on any routes.

When consolidating individual project types into a single TOPS-BC improvement category as shown in Table 2.1, the analysis was done using the average coverage value across all relevant categories used.

<sup>20</sup> MetroPlan Orlando. *Tracking the Trends*, June 2016. p23.

<sup>21</sup> MetroPlan Orlando. *Travel Time Studies and B/C Analysis*, 2014. p185.

Therefore, the benefit parameters associated with each of these four TOPS-BC categories (see next section) will reflect the expected impacts of full coverage by all of these strategies in each category.

### B.3.3 Coverage Results

Table B.2 indicates the extent of coverage for each project category by corridor and jurisdiction, calculated according to the methodology presented in Table B.1. A value of 0% indicates that the strategy does not exist at all on the segment.

**Table B.2 Extent of Corridor Coverage for each ITS Strategy Type**

A dash (—) indicates that a segment does not exist in the given jurisdiction.

## B.4 TOPS-BC Impact Parameters by Segment

Using a baseline set of benefit impact parameters associated with each of the major categories of ITS strategies (see Table 2.1), the specific impact parameters to use for each segment can be calculated by rescaling the baseline values according to the extent of coverage for each strategy on any given corridor. This section provides the procedural details associated with these calculations, as well as the resultant impact values.

### B.4.1 Baseline Benefit Impact Parameters

Table B.4 shows the baseline impact parameters used in this analysis for strategies deployed on arterial segments, while Table B.5 provides analogous parameter values for freeway segments. These parameters are informed by previous studies, simulations, modeling efforts, and reports associated with local, regional, and national efforts. Additionally, the U.S. Department of Transportation maintains a benefits database with extensive documentation on ITS impacts and outcomes spanning a broad range of technologies and municipal settings.<sup>22</sup> The table shows only the parameter values in the TOPS-BC model that are primarily impacted by the ITS Strategy. There are several secondary benefits which do not have parameters. For example, any changes in speeds are captured more directly by the impact factors for capacity-related gains.

For each ITS strategy category, the benefit impact parameters reflect the expected impacts of full coverage by all of the strategies in each category. As mentioned previously, these impact parameters can then be tailored to specific corridors by rescaling them according to the extent of coverage for a given strategy category on the corridor.

For the information dissemination strategy category, the percent of time that the device is engaged in conveying useful information does not reflect the total amount of time that the system is active. Instead, it reflects the expected percent of time that the displayed information will contribute toward rerouting or other behavioral changes by drivers, which would not be expected during uncongested conditions (i.e., when conditions are exactly as drivers would have assumed even without the system to provide confirmation).

**Table B.4 Arterial Parameter Values by ITS Strategy Category**

Impact	Signalization Improvement	Incident Management	Information Dissemination
Change in Capacity	10%	—	—
Reduction in Non-Fatality Crash Rate	2%	10%	—
Reduction in Crash Duration	—	40%	—
Reduction in Fuel Use	5%	—	—
Percent of time device is disseminating useful information	—	—	20%
Percent drivers using information	—	—	10%
Minutes saved by drivers acting on the information	—	—	5

A dash (—) indicates that a given ITS strategy category is not expected to have that type of impact.

<sup>22</sup> <http://www.itsbenefits.its.dot.gov/>

**Table B.5 Freeway Parameter Values by ITS Strategy**

Impact	Signalization Improvement	Incident Management	Information Dissemination
Change in Capacity	1%	—	—
Reduction in Non-Fatality Crash Rate	1%	9%	—
Reduction in Fatality Crash Rate	—	1%	—
Reduction in Crash Duration	—	25%	—
Reduction in Fuel Use	1%	2%	—
Percent of time device is disseminating useful information	—	—	25%
Percent drivers using information	—	—	10%
Minutes saved by drivers acting on the information	—	—	3

A dash (—) indicates that a given ITS strategy category is not expected to have that type of impact.

#### B.4.2 Procedure for Calculating Impact Parameters by Corridor

Suitable benefit impact factors by corridor are calculated by scaling down the impact factors shown in Table B.4 and Table B.5 by the percent coverage for each TOPS-BC improvement category shown in Table B.3. The one exception to this general approach is associated with the Freeway/Arterial Travel Time System category. For that, only one factor will be scaled according to percent coverage on the segment: the number of minutes saved by drivers using the information. All other impact parameters in this category remained unchanged regardless of coverage extent, since they are only used in TOPS-BC as scale factors for the number of minutes saved by drivers using the information. Thus, if *all* of the impact parameters in this TOPS-BC improvement category had been rescaled according to coverage extent, the overall result would be a disproportionately large penalty being applied to the overall benefits on that corridor associated with the travel time system.

For each corridor, the rescaled parameters across the two (for freeway corridors) or three (for arterial corridors) different ITS strategy categories are then consolidated into a single set of impact parameters for that corridor by taking the sum across all categories. This is based on the observation that the different strategy categories generally use different mechanisms for achieving their results, and therefore may be expected to have minimal overlap with respect to impacts. As Table B.4 and Table B.5 indicate, this summation is only required for the impact factors related to reductions in non-fatality crash rates and for fuel savings on freeways, as these are the only impact factor classes that have contributions from multiple TOPS-BC benefit categories.

#### B.4.3 Benefit Impact Parameters by Analysis Corridor

The overall impact factors by corridor, as calculated according to the procedures above, are summarized in Table B.6.

**Table B.6 Calculated Overall Benefit Impact Factors by Corridor**

Impact	Corridor							
	A	B	C	D	E	F	G	H
<b>Orange County</b>								
Change in Capacity	6%	4%	0%	—	4%	—	—	0%

Minutes saved by drivers using the info	—	—	—	—	—	—	0%	1.5

A dash (—) indicates that a segment does not exist in the given jurisdiction.

## B.5 Transit Strategy Benefit Analysis Methodology

Because TOPS-BC Version 1.2 does not have native capabilities for estimating the benefits associated with transit strategies, an alternative benefit analysis method has been used to evaluate the value of two key transit-oriented strategies in the Orlando Urban Area: transit signal priority and automated vehicle location information.

### B.5.1 Methodology for Transit Benefit Estimation

The specific methodology for estimating transit-related benefits from AVL and TSP is provided below. These procedures are used in conjunction with the calculated transit vehicle and signal inventory results shown in Table A.28.

- Applying the assumed savings per intersection with TSP, while also assuming that only 37.5% of the vehicles and intersections Orlando Urban Area are properly equipped for TSP,<sup>23</sup> an overall estimate for the total time savings achieved by LYNX passengers through TSP is estimated by multiplying these quantities:
  - the total number of intersections traversed
  - the total time savings per intersection
  - the percent of intersections that are estimated to be TSP-equipped
  - the percent of vehicles that are estimated to be TSP-equipped
- This result is combined with the AVL-related savings, which is calculated by multiplying the total number of passenger trips per year by the assumed time savings per trip.
- Finally, the total time savings is monetized according to the standard TOPS-BC assumed value of time for “other” auto trips (see Table B.8).

The resultant estimates for time savings associated with AVL and TSP are reported in Table B.7. The dollar values corresponding to these calculated time savings are provided in Appendix D, Table D.3.

<sup>23</sup> MetroPlan Orlando ITS Master Plan Workshop #1 Presentation Slides, April 29, 2016. Slide 41.

**Table B.7     Calculated Quantities for Transit Benefits on LYNX**

Quantity	Orange County	Seminole County	Osceola County	All Counties
Time savings associated with TSP annually (hours)	110,136	29,515	16,297	155,948
Time savings associated with AVL annually (hours)	75,568	12,985	16,700	105,253
Time savings associated with transit strategies annually (hours)	185,704	42,500	32,997	261,201

### B.5.2     Transit Benefit Analysis Assumptions

The assumed benefit of 10 seconds achieved when a TSP-enabled vehicle traverses a TSP-equipped intersection is based on the assumption of a standard 120-second cycle, which corresponds to a red interval of 60 seconds. The average delay for a bus arriving during the red phase is therefore 30 seconds (i.e., half of the entire red time), and the probability of a bus arriving randomly during the red phase is approximately 50%. Therefore, the expected value for bus delay at each intersection is 15 seconds. Making the additional assumption that TSP improves the probability that a given bus will arrive during the green phase by 50% (i.e., to an overall probability of 75% for an arrival during the green phase), this reduces the average delay across all buses by 50% (or 7.5 seconds per bus on average). When taking into consideration the additional time savings associated with avoided acceleration and deceleration time, a value of approximately 10 seconds per transit vehicle is obtained, which is then passed along to each passenger that is carried by a TSP-equipped transit vehicle through each TSP-equipped intersection.

The assumption of fleet-wide availability of AVL technology is based on a recent media article describing the deployment of AVL services across all LYNX rolling stock.<sup>24</sup>

## B.6     Benefit Monetization Parameters

Once benefits have been quantified in TOPS-BC, they must be converted to equivalent dollar values suitable for aggregation and subsequent cost/benefit analysis. Table B.8 summarizes the economic parameters used for this monetization process. The parameter values are largely based on guidance from TOPS-BC documentation. These values are supplied directly to TOPS-BC as inputs, which the tool then uses to calculate the dollar values associated with the improvements on each corridor by benefit type.

<sup>24</sup> Mentor Graphics Corporation. *LYNX Fixed Route Improves On-Time Service with an ITS Solution from Mentor Engineering*. Embedded Computing Design. February 19, 2009. <http://embedded-computing.com/news/lynx-its-solution-mentor-engineering/> (accessed 10-18-2016).

**Table B.8 Economic Benefit Parameters**

Benefit Parameter	Parameter Value
Number of travel days in a year	250
Dollar value of person hour, "on the clock" auto	\$32.46
Dollar value of person hour, other auto	\$16.23
Dollar value of vehicle hour, truck	\$32.46
Average cost per gallon of fuel	\$4.25
Dollar value of a fatality crash	\$10,433,467
Dollar value of an injury crash	\$77,671
Dollar value of a property damage-only crash	\$2,666

## B.7 Benefit Analysis Methodology for Supplementary Off-Network Routes

For adaptive traffic signal control (ATCS), average per-mile benefit rates have been calculated for the core analysis network (i.e., the routes in Figure 2.2) and the impact factors associated with Signalization Improvements in Table B.4. As ATCS applies only to arterials, no freeway routes from the core analysis network were included in this calculation of average benefit rates per mile. Based on this procedure, the average annual benefit associated with ATCS for arterials was evaluated as \$86,278 per mile (see Table B.9 for breakdown by benefit category).

For traveler information data distributed through a 511 system, average per-mile benefit rates have been calculated for the core analysis network, separately for arterials and freeways. The impact factors used are those shown in Table B.4 and Table B.5 for information dissemination, reduced by a factor of two in consideration of the fact that traveler information from 511 systems is assumed to constitute only half of the benefit associated with the travel time system impacts, as indicated in Table 2.1. Based on this procedure, the average annual benefit associated with traveler information data distributed through a 511 system is \$16,999 per mile for arterials, and \$25,377 per mile for freeways (see Table B.9 for breakdown by benefit category).

**Table B.9 Average Annual Benefits per Mile, by Strategy**

Investment Type	Recurrent Travel Time Benefit	Incident Related Delay Benefit	Incident Related Crash Benefit	Fuel Savings
Arterial Traveler Information	\$0	\$16,999	\$0	\$0
Freeway Traveler Information	\$0	\$25,377	\$0	\$0
Arterial Signal Timing & Control Strategies	\$5,021	\$136	\$31,825	\$49,296

## Appendix C. Cost Analysis Methodology and Details

This appendix expands upon the methodology overview provided in Chapter 2.0 by describing the detailed procedures, assumptions, and inputs that have been used to generate the estimated costs by jurisdiction and category as presented in Chapter 3.0. The specific topics included in this appendix include:

- Background and explanation of the cost terminology used in this analysis.
- List of the major assumptions applied to this analysis, to maintain a tractable procedure and to reflect the degree of cost data readily available.
- Detailed reference cost data by component for each ITS strategy being considered as part of this analysis.
- Procedures, sample calculations, and results associated with the conversion of component cost data into overall annualized direct and indirect costs by ITS strategy.
- Procedures and sample calculations associated with the allocation of regionwide costs to individual counties.

### C.1 Background

In this analysis, costs are handled on a relatively detailed level; every major component is assessed separately in terms of its capital cost, useful life, and O&M cost. Each ITS system is additionally split into the **direct cost** of resources in the field (e.g., CCTV cameras, changeable message signs, ramp meters), and the **indirect cost** associated with their accompanying supporting systems (e.g., centralized software to coordinate and control each system, TMC operators monitoring each system, equipment integration costs/labor). The direct cost of resources in the field is marginal, being incurred on an incremental basis with each additional deployment. In contrast, the indirect costs associated with the supporting systems are generally incurred on an approximately fixed basis, occurring with the first deployment and remaining unchanged as additional components of the same type are added. Direct costs include capital and O&M costs for the field equipment itself, while indirect costs similarly include capital and O&M costs for the supporting systems.

For both direct and indirect costs, there are generally two distinct components:

- **Initial:** deployment costs (which include both the capital cost of the equipment/system and the cost of installation)
- **Ongoing:** operations and maintenance costs

Whereas O&M costs are incurred on an ongoing (yearly) basis, the deployment costs are incurred only once over the useful life of the equipment—specifically, when it is purchased, installed, and configured. Since benefit/cost analyses are generally conducted by comparing annual costs to annual benefits (to ensure a reasonable comparison), these deployment costs need to be amortized over the life of the project. Therefore, for the purposes of this analysis, the deployment costs are converted into equivalent annualized initial costs that are spread evenly across the expected useful life of the system and its components. Details regarding

the procedures and calculations used to convert deployment costs into annualized equivalent costs are provided in the following sections.

## C.2 High-Level Assumptions

The following assumptions have been made as part of this cost analysis, to maintain the most straightforward interpretation of results and avoid potential problems associated with using an inaccurate or inappropriate discount/inflation rate:

- No discounting of costs is performed.
- No annual inflation is taken into consideration.

If desired, the information provided in this section is sufficient to conduct additional benefit/cost analyses with non-zero inflation or discount rates, though such an analysis has not been performed here.

For the purposes of this analysis, the total direct costs are assumed to scale proportionally with the number of deployments (i.e., the direct cost of deploying CCTV at three locations is three times the cost of deploying CCTV at one location), while the total indirect costs are assumed fixed, independent of the number of deployments (i.e., the cost of labor/software to control and monitor the cameras is the same whether the system is comprised of 150 cameras or 175).

Furthermore, while each county has been assumed to operate and maintain its own TMC, this analysis includes the overall cost of only one TMC, in acknowledgment of the fact that these eight corridors being analyzed are only a subset of the corridors being monitored, managed, and operated by each of the counties' TMCs. In addition, given the expected wide range of institutional, logistical, and planning functions performed by a dedicated TMC, this assessment ascribes only 25% of the costs of the TMC facility to supporting the strategies considered in this analysis.

## C.3 Reference Cost Tables by ITS Strategy

Capital costs, O&M costs, and useful life estimates by component were informed by guidance from FHWA as provided in TOPS-BC, and have been subsequently reviewed and revised for reasonableness. The specific values used for each ITS strategy and component are provided in Table C.1 through Table C.12. Additionally, the following references and data have been used for specific strategies that were not addressed by TOPS-BC:

- **Automatic Vehicle Location Systems for Transit.** AVL useful life estimates are based on the combined useful life of all TSP components weighted by annualized cost, while AVL cost estimates are based on findings from the TCRP Synthesis 73.<sup>25</sup> For AVL systems, four FTEs are assumed to be required for system maintenance, operation, and IT functions, based on findings from the TCRP Synthesis 73.<sup>26</sup>

---

<sup>25</sup> *TCRP Synthesis 73: AVL Systems for Bus Transit Update*. Transportation Research Board, 2008. p4. <http://www.tcrponline.org/PDFDocuments/tsyn73.pdf> (accessed 10-21-2016).

<sup>26</sup> *TCRP Synthesis 73: AVL Systems for Bus Transit Update*. Transportation Research Board, 2008. Tables 17, 18, and 21. <http://www.tcrponline.org/PDFDocuments/tsyn73.pdf> (accessed 10-21-2016).

- **Transportation Management Centers.** These costs have been informed by similar center costs in California as owned and operated by Caltrans.<sup>27</sup>
- **Fiber Communication (Freeway).** These costs have been informed by similar Fiber communications costs in California as owned and maintained by Caltrans.<sup>28</sup>
- **Fiber Communication (Arterials).** These costs have been informed by similar Fiber communications costs in an urban arterial environment, as estimated for ITS in Chicago, IL.<sup>29</sup> Fiber is assumed to be installed underground.
- **DMS-Based Traveler Information (Freeway).** These costs have been informed by similar system costs in California as owned and maintained by Caltrans.<sup>30</sup>
- **DMS-Based Traveler Information (Arterial).** These costs have been informed by similar system costs in an urban arterial environment, as estimated for ITS in Chicago, IL.<sup>31</sup>
- **Signal Retiming Studies.** These costs have been obtained directly from MetroPlan Orlando for 2014, for projects that applied to the eight corridors in this cost analysis.<sup>32</sup> Similar costs are assumed to be incurred annually. Costs are estimated per intersection, rather than per mile, as the correlation between cost and intersection count ( $R^2$  value of 0.86) was found to be stronger than the correlation between cost and corridor length ( $R^2$  value of 0.68).
- **Emergency Vehicle Preemption.** These costs have been informed by similar EVP system costs in an urban arterial environment, as estimated for ITS in Chicago, IL.<sup>33</sup> Useful life estimates are obtained from TOPS-BC estimates for similar TSP components.
- **CCTV Cameras (Freeway).** These costs have been informed by similar freeway-based camera deployments in California as owned and maintained by Caltrans.<sup>34</sup>
- **CCTV Cameras (Arterials).** These costs have been informed by similar freeway-based camera deployments in an urban arterial environment, as estimated for ITS in Chicago, IL.<sup>35</sup>

Note that labor costs are considered for each strategy separately, such that no additional labor considerations are made in the TMC cost category. Rather, the TMC cost table is intended to capture the capital and maintenance cost of the facility itself, apart from the systems and staff associated with the various strategies listed in this section.

<b>Direct Costs (incurred per vehicle)</b>				
Onboard Equipment	7	\$17,577	*	\$2,511
Total Incremental Cost	—	\$17,577	*	\$2,511

\* These maintenance costs are captured by the O&M costs for the overall (central) system.

## C.4 Calculating Overall Annualized Direct and Indirect Costs

This section describes the procedures used to convert the direct costs by component shown in Table C.1 through Table C.12 into (1) overall annualized direct costs per unit and (2) annualized indirect costs regionwide for supporting systems, for each ITS strategy type as deployed in the Orlando Urban Area.

### C.4.1 Procedure

The direct costs associated with field equipment physically installed in each jurisdiction (i.e., ramp meters, dynamic message signs, CCTV, and fiber) are calculated in terms of their initial (i.e., capital) and recurring (i.e., maintenance) costs, and are allocated to their individual jurisdictions accordingly. The indirect costs associated with this field equipment, defined be the costs of supporting systems that accompany the equipment (e.g., centralized software to coordinate and control each system, Transportation Management Center operators monitoring each system, equipment integration costs/labor), are assumed to be independent of the number of devices deployed. These indirect costs are calculated and subsequently distributed across all jurisdictions to which they apply, weighted by the number of deployments on each corridor.

### C.4.2 Example

For example, the component cost data for arterial CCTV cameras is provided in Table C.1. Using standard amortization procedures, the overall annualized direct and indirect costs associated with arterial CCTV deployments in the Orlando Urban Area are:

$$\text{Direct (Incremental) Costs Per Camera} = \text{Annualized Capital Costs} + \text{O\&M Costs}$$

$$\text{Annualized Capital Costs} = \left( \frac{\$15,000 \text{ per camera \& pole}}{10 \text{ year useful life}} \right) = \$1,500/\text{year}$$

$$\text{O\&M Costs} = (\$750/\text{camera})$$

$$\text{Direct (Incremental) Costs} = \$1,500 + \$750 = \$2,250$$

$$\text{Indirect (Infrastructure) Costs} = \text{Annualized Capital Costs} + \text{O\&M Costs}$$

$$\begin{aligned}
 \text{Annualized Capital Costs} &= \left( \frac{\$150,000 \text{ for hardware \& software}}{20 \text{ year useful life}} \right) \\
 &\quad + \left( \frac{\$250,000 \text{ for system integration}}{20 \text{ year useful life}} \right) \\
 &= \$20,000
 \end{aligned}$$

$$\begin{aligned}
 \text{O\&M Costs} &= (\$7,500 \text{ for hardware \& software}) + (\$12,500 \text{ for system integration}) \\
 &= \$20,000
 \end{aligned}$$

$$\text{Indirect (Infrastructure) Costs} = \$20,000 + \$20,000 = \$40,000$$

These calculated values for direct and indirect costs associated with arterial CCTV deployments are reported in Table C.13 of the following section.

### C.4.3 Results

Table C.13 provides a summary of the overall annualized direct and indirect costs associated with each ITS strategy, following the procedures described in the preceding section. Table 2.2 provides a summary of the components included in each cost category for each ITS system. Annualized costs are calculated with consideration of the useful life for each component separately.

**Table C.13 Cost Summary by ITS System**

ITS System	Direct Costs (per Field Deployment)			Indirect Costs (e.g., Integration, Monitoring)		
	Capital & Installation	O&M per Year	Annualized Equivalent	Capital & Integration	O&M per Year	Annualized Equivalent
CCTV on Arterials	\$15,000 per camera	\$750 per camera	\$2,250 per camera	\$400,000 in TMC costs	\$20,000 in TMC costs	\$40,000 in TMC costs
CCTV on Freeways	\$50,000 per camera	\$2,475 per camera	\$5,975 per camera	—	Same as above	—
Ramp Meters	\$99,750 per ramp	\$2,750 per ramp	\$6,740 per ramp	\$222,500 in TMC costs	\$252,000 in TMC costs	\$296,500 in TMC costs
Arterial DMS Traveler Information	\$87,500 per sign	\$4,150 per sign	\$7,650 per sign	\$127,500 in TMC costs	\$6,375 in TMC costs	\$16,875 in TMC costs
Freeway DMS Traveler Information	\$299,250 per sign	\$6,275 per sign	\$22,892 per sign	—	Same as above	—
511 Traveler Information System	—	N/A	—	\$1,407,500 in TMC costs	\$511,900 in TMC costs	\$612,650 in TMC costs
Road Rangers Service Patrol	\$85,750 per truck	\$115,250 per truck	\$127,423 per truck	\$354,250 in TMC costs	\$204,400 in TMC costs	\$236,388 in TMC costs

ITS System	Direct Costs (per Field Deployment)			Indirect Costs (e.g., Integration, Monitoring)		
	Capital & Installation	O&M per Year	Annualized Equivalent	Capital & Integration	O&M per Year	Annualized Equivalent
TMC General Functions	—	N/A	—	\$30,000,000 for facility	\$1,500,000 for facility	\$2,700,000 for facility
Fiber Optic on Arterials	\$375,000 per mile	\$250 per mile	\$19,000 per mile	—	None	—
Fiber Optic on Freeways	\$300,000 per mile	None	\$15,000 per mile	—	None	—
Centralized Signal Control/Coordination	\$18,000 per intersection	\$4,850 per intersection	\$7,617 per intersection	\$290,000 in TMC costs	\$543,100 in TMC costs	\$592,850 in TMC costs
Emergency Vehicle Preemption*	\$1,000 per vehicle	None	\$100 per vehicle	\$10,000 per intersection	\$600 per intersection	\$2,600 per intersection
Transit Signal Priority*	\$650 per vehicle	\$20 per vehicle	\$85 per vehicle	\$7,500 per intersection	\$315 per intersection	\$1,290 per intersection
Automatic Vehicle Location System	\$17,577 per vehicle	None	\$2,511 per vehicle	\$2,506,759 in TMC costs	\$448,000 in TMC costs	\$806,108 in TMC costs

\* Infrastructure costs are indicated in the Indirect Cost column, though these are incurred by infrastructure installation location (as is more common for direct costs).

## C.5 Allocating Costs by Jurisdiction

This section describes the procedures used to suitably apportion the regionwide indirect costs associated with supporting systems across the three counties in the Orlando Urban Area.

### C.5.1 Procedures

For support systems associated with field equipment deployed at various locations across the three counties (as indicated in Table A.26), indirect costs associated with the accompanying support systems and infrastructure are calculated and apportioned to the three counties according to the percent of all field devices that are deployed in each jurisdiction.

For systems that provide coverage to the entire network without physical equipment installations along particular routes, the cost calculation involves computing the total cost throughout the Orlando Urban Area and subsequently distributing it across each county according to the methods indicated in Table C.14.

**Table C.14 Distributed Costs and Associated Methods for Disaggregating**

<b>Distributed Cost Type</b>	<b>Method for Disaggregating Across Counties</b>
Road Rangers Service Patrol	Apportion by county according to the percent of I-4 mileage within the county, out of the full length of I-4 through all three counties.
General TMC Services	Apportion by county according to the total corridor mileage within the county, out of the total corridor mileage across all three counties.
511 Traveler Information System	Apportion by county according to the same method as General TMC services above.
Transit AVL and TSP Services (equipped vehicles only)	Apportion by county according to the percent of directional LYNX route mileage within the county, out of the total directional LYNX route mileage across all three counties.

### C.5.2 Examples

CCTV is one ITS strategy with field deployments located throughout the three counties. Therefore, since 17% of arterial CCTV cameras across the eight analysis corridors are deployed in Orange County, 17% of the annualized indirect costs for arterial CCTV monitoring and support (\$40,000 per year total) would also be attributed to Orange County.

Road Rangers Service Patrols are deployed across all segments of I-4, but do not have any field devices or site installations associated with this strategy. Instead, the costs of this strategy are computed at a regionwide level first using the annualized Direct and Indirect Cost values in Table C.13, and subsequently allocated to the three counties based on the relative amounts of I-4 mileage in each one. More precisely:

$$\text{Overall Cost for Seminole County} = (\text{Overall Cost of Road Rangers}) \left( \frac{14.14 \text{ miles}}{46.69 \text{ miles}} \right)$$

$$\text{Overall Cost of Road Rangers} = (\text{Direct Costs}) (12 \text{ vehicles}) + \text{Indirect Costs}$$

$$\text{Overall Cost of Road Rangers} = (\$127,423) (12 \text{ vehicles}) + \$236,388 = \$1,765,462$$

$$\text{Overall Cost for Seminole County} = (\$1,765,462) \left( \frac{14.14 \text{ miles}}{46.69 \text{ miles}} \right) = \$534,668$$

## C.6 Cost Analysis Methodology for Supplementary Off-Network Routes

For the supplemental off-network traveler information system, the total project cost is \$3,690,000.<sup>36</sup> This cost is assumed to include maintenance and jurisdiction over the useful life of the investment, which is furthermore assumed to be 10 years. Based on these assumptions, the annualized cost of this supplemental off-network traveler information system is \$369,000. This cost is split across all counties according to mileage of supplemental routes within each jurisdiction.

<sup>36</sup> Email correspondence with Jim Stroz of Florida DOT on 2-28-2017.

For the supplemental off-network ATCS costs, the per-mile average annual cost of signalization improvements across all jurisdictions will be used to extrapolate the off-network costs based on mileage, where the per-mile rates will be obtained from the core analysis network. As shown in Table C.15, this per-mile cost is \$43,988 annually.

**Table C.15 Annualized Costs by Category, for the Core Analysis Corridors Only**

Cost Category	Arterial Annual Cost	Freeway Annual Cost	Total Annual Cost	Per-Mile Annual Cost
<b>All Counties</b>				
Signal Improvements	\$5,121,316	\$1,815,550	\$6,936,866	\$43,988
Incident Management	\$847,734	\$1,966,894	\$2,814,628	\$17,848

## Appendix D. Detailed Benefit-Cost Results

This section includes detailed cost and benefit results by jurisdiction and analysis corridor, providing a greater degree of fidelity than the summary result tables shown in Chapters 3 and 4. The specific results available in this appendix include:

- Detailed estimates of annualized costs associated with each ITS strategy type, disaggregated by jurisdiction (see Table D.1).
- Detailed results for the supplemental off-network analysis of benefits and costs.
- Detailed estimates of monetized annual benefits by category, corridor, and jurisdiction, for the baseline analysis scenario (see Table D.3) and the six alternative scenarios presented in Chapter 4 as part of the sensitivity analysis.

### D.1 Cost Results by Jurisdiction

Note that transit strategy benefits are not calculated by corridor, as the scope of analysis for the transit strategies included the full LYNX network rather than just the eight corridors shown in Figure 2.2. Consequently, the transit results are reported by county but not by corridor.

**Table D.1 Total Annualized Costs by Project Type, for each Jurisdiction**

	Orange County	Seminole County	Osceola County	Total
CCTV on Arterials	\$49,476	\$177,071	\$67,704	\$294,250

511 Traveler Information System (arterials)*	\$267,209	\$108,824	\$0	\$376,033
511 Traveler Information System (freeways)*	\$173,395	\$40,579	\$22,643	\$236,617
Road Rangers Service Patrol*	\$932,633	\$534,553	\$298,276	\$1,765,462
TMC Facility (arterials)*	\$261,708	\$106,583	\$74,963	\$443,254
TMC Facility (freeways)*	\$169,825	\$39,744	\$22,177	\$231,746
Fiber Optic on Arterials	\$961,590	\$657,780	\$375,630	\$1,995,000
Fiber Optic on Freeways	\$1,299,600	\$424,200	\$0	\$1,723,800
Centralized Signal Control/Coordination	\$1,587,066	\$773,034	\$250,024	\$2,610,124
Emergency Vehicle Preemption (signals)	\$204,594	\$118,508	\$65,962	\$389,064
Emergency Vehicle Preemption (vehicles)	\$76,244	\$27,139	\$18,579	\$121,962
Transit Signal Priority (signals)	\$625,005	\$116,584	\$84,656	\$826,245
Transit Signal Priority (vehicles)	\$7,618	\$780	\$1,165	\$9,563
Automatic Vehicle Location System*	\$1,242,291	\$127,146	\$189,971	\$1,559,408
Signal Retiming (annually)	\$82,876	\$112,074	\$60,882	\$255,832
<b>Total</b>	<b>\$7,978,694</b>	<b>\$3,705,293</b>	<b>\$1,532,631</b>	<b>\$13,216,618</b>

A dash (—) indicates that a strategy did not have a significant documented deployment in the given jurisdiction.

\* These costs were first calculated systemwide across all jurisdictions, and then distributed across each county according to the procedures in Appendix C.

## D.2 Results for Supplementary Off-Network Routes

The extrapolated costs and benefits associated with each investment type on the off-network routes (see Figure 2.5) are summarized by jurisdiction in Table D.2.

**Table D.2 Annualized Costs and Benefits for Supplemental Off-Network Routes**

## **APPENDIX B**

### Vision, Goals & Objectives Survey Questionnaire

**MetroPlan Orlando ITS Master Plan Survey Questionnaire**  
ITS Steering Committee Members

This survey questionnaire is intended to assist the ITS Steering Committee in developing a draft vision statement, goals, and objectives for the MetroPlan Orlando ITS Master Plan. The survey results will be used to prepare a draft vision statement, along with draft goals and objectives, for a presentation at the next Quarterly Progress Meeting scheduled for March 16, 2016.

Please provide your ideas and suggestions in the spaces below or in a separate email. Your responses can be in sentences, phrases or simply key words. To assist your efforts, we've selected examples of current vision statements, goals and objectives that have been adopted by other MPOs, regional organizations, and counties in Florida and around the nation.

In a separate attachment to this survey, is a list of relevant vision, goals and objectives that are contained in adopted FDOT ITS Plans and MetroPlan Orlando Plans. This information will be useful in helping us to promote consistency between the MetroPlan Orlando ITS Master Plan and other adopted state and regional ITS plans.

1. What should be included in a Vision Statement for the Metroplan Orlando ITS Master Plan? *Think of the vision statement as the purpose of ITS and what ITS should become.*

*Examples of adopted ITS Vision Statements, include:*

- *Maximize the use of the existing Transportation system by providing increased accessibility, reliability, and safety as a part of a fully integrated multi-modal experience. (Space Coast TPO)*
  - *The Intelligent Transportation System shall strive to become an institutionally integrated and fully cooperative coalition of all transportation, public safety and emergency services stakeholders in the region and beyond; an information-rich source of travel information for all wi in the region and beyond;... (First Coast TPO)*
  - *Regional ITS partner agencies will deploy efficient management processes and systems to promote and facilitate cooperative, regional and multimodal operations (Denver Regional Council of Governments)*
2. What are some suggested Goals for the ITS Master Plan? *Consider a Goal to be a way to achieve the ITS Vision...a more defined purpose or end that provides direction for agency and community decisions.*

*Examples of adopted ITS Master Plan Goals, include:*

- *The metropolitan region will use the best available technology to maximize system efficiencies. (Metropolitan Washington Council of Governments)*
  - *Enhance the safety and security for all transportation modes (Hillsborough County MPO).*
3. Identify any Objectives you feel should be used to measure the achievement of a Goal. *Consider an objective to be an attainable and measureable statements of the actions needed to carry out the plan.*

*Examples of adopted ITS Master Plan Objectives and measures, include:*

- *Reduce system wide delay for automobiles, transit, and trucks. Measure: vehicle hours of delay*
- *Improve real time transit operations. Measure: Percent of transit routes with real time monitoring*
- *Minimize the duration of highway and transit incidents. Measurement: verification, response and clearance times.*
- *Increase ITS investments to improve system performance. Measurement: increase in ITS funding*

Please send your comments to Howard Glassman at [hglassman@gfnet.com](mailto:hglassman@gfnet.com). I can be reached at (850) 309-7904 (Office) or (850) 508-5029 (Cell) should you have any questions. Thank you for participating.

## **APPENDIX D**

### Regional ITS Architecture Data Sharing Needs Definitions

The following are the definitions of the data sharing needs as defined in the Regional ITS Architecture.

- **Alarm** - Information about a Commercial Vehicle or Freight Equipment breach, non-permitted security sensitive hazmat detected at the roadside, route deviation, or Commercial Vehicle Driver / Commercial Vehicle / Freight Equipment assignment mismatches which includes the location of the Commercial Vehicle and appropriate identities.
- **Alarm Acknowledgement** - Confirmation that alarm was received, instructions and additional information for the alarm initiator, and requests for additional information.
- **Alarm Notification** - Notification of activation of an audible or silent alarm by a traveler in a public area or by a transit vehicle operator using an on-board device.
- **Alert Notification** - Notification of a major emergency such as a natural or man-made disaster, civil emergency, or child abduction for distribution to the public. The flow identifies the alert originator, the nature of the emergency, the geographic area affected by the emergency, the effective time period, and information and instructions necessary for the public to respond to the alert. This flow may also identify specific information that should not be released to the public.
- **Alert Notification Coordination** - Coordination of emergency alerts to be distributed to the public. This includes notification of a major emergency such as a natural or man-made disaster, civil emergency, or child abduction for distribution to the public and status of the public notification.
- **Alert Status** - Information indicating the current status of the emergency alert including identification of the traveler and driver information systems that are being used to provide the alert.
- **Archive Coordination** - Catalog data, meta data, published data, and other information exchanged between archives to support data synchronization and satisfy user data requests.
- **Archive Data Products** - Raw or processed data, meta data, data catalogs and other data products provided to a user system upon request. The response may also include any associated transaction information.
- **Archive Data Product Requests** - A user-specified request for archived data products (i.e. data, meta data, or data catalogs). The request also includes information that is used to identify and authenticate the user and support electronic payment requirements, if any.
- **Archive Requests** - A request to a data source for information on available data (i.e. "catalog") or a request that defines the data to be archived. The request can be a general subscription intended to initiate a continuous or regular data stream or a specific request intended to initiate a one-time response from the recipient.
- **Archive Status** - Notification that data provided to an archive contains erroneous, missing, or suspicious data or verification that the data provided appears valid. If an error has been detected, the offending data and the nature of the potential problem are identified.
- **Asset Inventory** - Information on pavement, bridges, signs and other assets. This includes asset location, installation information, materials information, vendor/contractor information, current maintenance status, and a variety of other information (e.g., video logs) that define the transportation infrastructure.
- **Asset Restrictions** - Restrictions levied on transportation asset usage based on infrastructure design, surveys, tests, or analyses. This includes standard height, width, and weight restrictions by facility as well as special restrictions such as spring weight restrictions and temporary bridge weight restrictions.

- **Asset Status Update** - Changes to status of pavement, bridges, signs and other assets resulting from maintenance or construction activities or infrastructure monitoring. The updates may include changes in installation information, materials information, vendor/contractor information, condition, and current maintenance status. In addition to infrastructure asset updates, the information provided may also include status of the maintenance and construction support assets, including vehicle and equipment utilization and repair records.
- **Bad Tag List** - List of invalid transit user tags which may have previously failed a fare payment transaction.
- **Broadcast Traveler Information** - General traveler information that contains traffic and road conditions, link travel times, incidents, advisories, restrictions, transit service information, weather information, parking information, and other related traveler information.
- **Care Facility Status** - Information regarding facility type and capabilities, facility status, and its ability to admit new patients.
- **Care Facility Status Request** - Request for information regarding care facility availability and status.
- **CCTV Images** - High fidelity, real-time CCTV images.
- **Commercial Vehicle Breach** - Information about a breach or tamper event on a Commercial Vehicle or its attached freight equipment which includes identity, type of breach, location, and time.
- **Cooperative Adaptive Cruise Control Parameters** - Information, instructions, and control parameters for cooperative cruise control including current system conditions and advisories, control parameters (e.g., speed, required vehicle performance profiles, gaps or headways) and check in/checkout instructions.
- **Cooperative Adaptive Cruise Control Status** - Data describing the vehicle's location in three dimensions, heading speed, acceleration, braking status, and size.
- **Crash Data** - Information about incidents on state, county, or city roadways.
- **Current Asset Restrictions** - Restrictions levied on transportation asset usage based on infrastructure design, surveys, tests, or analyses. This includes standard facility design height, width, and weight restrictions, special restrictions such as spring weight restrictions, and temporary facility restrictions that are imposed during maintenance and construction.
- **Decision Support Information** - Information provided to support effective and safe incident response, including local traffic, road, and weather conditions, hazardous material information, and the current status of resources that have been allocated to an incident.
- **Demand Responsive Transit Plan** - Plan regarding overall demand responsive transit schedules and deployment.
- **Device Control Request** - Request for device control action.
- **Device Data** - Data from detectors, environmental sensor stations, and traffic control devices including device inventory information.
- **Device Status** - Status information from devices.
- **Driver Alert Response** - Commercial Vehicle Driver response to a breach alert for a Freight Equipment breach or tamper event.
- **Driver Information** - Regulatory, warning, and guidance information provided to the driver while en route to support safe and efficient vehicle operation.

- **Emergency Archive Data** - Logged emergency information including information that characterizes identified incidents (routine highway incidents through disasters), corresponding incident response information, evacuation information, surveillance data, threat data, and resource information. Content may include a catalog of available information, the actual information to be archived, and associated meta data that describes the archived information.
- **Emergency Dispatch Requests** - Emergency vehicle dispatch instructions including incident location and available information concerning the incident.
- **Emergency Dispatch Response** - Request for additional emergency dispatch information and provision of en route status.
- **Emergency Plan Coordination** - Information that supports coordination of emergency management plans, continuity of operations plans, emergency response and recovery plans, evacuation plans, and other emergency plans between agencies. This includes general plans that are coordinated prior to an incident and shorter duration tactical plans that are prepared during an incident.
- **Emergency Traffic Control Information** - Status of a special traffic control strategy or system activation implemented in response to an emergency traffic control request, a request for emergency access routes, a request for evacuation, a request to activate closure systems, a request to employ driver information systems to support public safety objectives, or other special requests. Identifies the selected traffic control strategy and system control status.
- **Emergency Traffic Control Request** - Special request to preempt the current traffic control strategy in effect at one or more signalized intersections or highway segments, activate traffic control and closure systems such as gates and barriers, activate safeguard systems, or use driver information systems. For example, this flow can request all signals to red-flash, request a progression of traffic control preemptions along an emergency vehicle route, request a specific evacuation traffic control plan, request activation of a road closure barrier system, or place a public safety or emergency-related message on a dynamic message sign.
- **Emergency Traffic Coordination** - Coordination supporting disaster response including evacuation and reentry. Includes coordination of special traffic control strategies that support efficient evacuation and reentry while protecting and optimizing movement of response vehicles and other resources responding to the emergency.
- **Emergency Transit Schedule Information** - Information on transit schedule and service changes that adapt the service to better meet needs of responders and the general public in an emergency situation, including special service schedules supporting evacuation.
- **Emergency Transit Service Request** - Request to modify transit service and fare schedules to address emergencies, including requests for transit services to evacuate people from and/or deploy response agency personnel to an emergency scene. The request may poll for resource availability or request pre-staging, staging, or immediate dispatch of transit resources.
- **Emergency Transit Service Response** - Response indicating changes to transit service, fares, and/or restrictions that will be made and status of transit resources to be deployed to support emergency response and/or evacuation.
- **Emergency Traveler Information** - Public notification of an emergency such as a natural or man-made disaster, civil emergency, or child abduction. This flow also includes evacuation information including evacuation instructions, evacuation zones, recommended evacuation times, tailored

evacuation routes and destinations, traffic and road conditions along the evacuation routes, traveler services and shelter information, and reentry times and instructions.

- **Vehicle Tracking Data** - The current location and operating status of the emergency vehicle.
- **Environmental Conditions Data** - Current road conditions (e.g., surface temperature, subsurface temperature, moisture, icing, treatment status) and surface weather conditions (e.g., air temperature, wind speed, precipitation, visibility) as measured and reported by fixed and/or mobile environmental sensors and aggregated by the data collector. Attributes relating to the data collection (and aggregation) are also included.
- **Environmental Conditions Data Status** - Status of the data quality of environmental conditions data provided by a data contributor. Includes not only status by sensor, but statistical data regarding the quality checking of data provided.
- **Environmental Probe Data** - Data from vehicle safety and convenience systems that can be used to estimate environmental conditions, including measured air temperature, exterior light status, wiper status, sun sensor status, rain sensor status, traction control status, anti-lock brake status, and other collected vehicle system status and sensor information. The collected data is reported along with the location, heading, and time that the data was collected. Both current data and snapshots of recent events (e.g., traction control or anti-lock brake system activations) may be reported.
- **Environmental Sensors Control** - Data used to configure and control environmental sensors.
- **Environmental Sensor Data** - Current road conditions (e.g., surface temperature, subsurface temperature, moisture, icing, treatment status) and surface weather conditions (e.g., air temperature, wind speed, precipitation, visibility) as measured and reported by fixed and/or mobile environmental sensors. Operational status of the sensors is also included.
- **Equipment Maintenance Status** - Current status of field equipment maintenance actions.
- **Evacuation Coordination** - Coordination of information regarding a pending or in-process evacuation. Includes evacuation zones, evacuation times, evacuation routes, forecast network conditions, and reentry times.
- **Evacuation Information** - Evacuation instructions and information including evacuation zones, evacuation times, and reentry times.
- **Event Confirmation** - Confirmation that special event details have been received and processed.
- **Event Plans** - Plans for major events possibly impacting traffic.
- **Fare Collection Data** - Fare collection information including the summary of on-board fare system data and financial payment transaction data.
- **Field Equipment Status** - Identification of field equipment requiring repair and known information about the associated faults.
- **Freight Equipment Information** - Container, trailer, or chassis information regarding identity, type, location, brake wear data, mileage, seal #, seal type, door open/close status, chassis bare/covered status, tethered / untethered status, Bill of Lading, and sensor status.
- **Freight Transportation Status** - A time-stamped status of a freight shipment as it passes through the supply chain from manufacturer through arrival at its final destination; including cargo movement logs, routing information, and cargo ID's.
- **Hazmat Information** - Information about a particular hazmat load including nature of the load and unloading instructions. May also include hazmat vehicle route and route update information.
- **Hazmat Information Request** - Request for information about a particular hazmat load.

- **Highway Control Status** - Current traffic control equipment status that indicates operational status and right-of-way availability to the non-highway transportation mode at a multimodal crossing.
- **Highway-Rail Intersection (HRI) Advisories** - Notification of Highway-Rail Intersection equipment failure, intersection blockage, or other condition requiring attention, and maintenance activities at or near highway rail intersections.
- **HRI Control Data** - Data required for HRI information transmitted at railroad grade crossings and within railroad operations.
- **HRI Operational Status** - Status of the highway-rail grade crossing equipment including both the current state or mode of operation and the current equipment condition.
- **HRI Request** - A request for highway-rail intersection status or a specific control request intended to modify HRI operation.
- **HRI Status** - Status of the highway-rail intersection equipment including both the current state or mode of operation and the current equipment condition.
- **Incident Command Information Coordination** - Information that supports local management of an incident. It includes resource deployment status, hazardous material information, traffic, road, and weather conditions, evacuation advice, and other information that enables emergency or maintenance personnel in the field to implement an effective, safe incident response.
- **Incident Information** - Notification of existence of incident and expected severity, location, time and nature of incident. As additional information is gathered and the incident evolves, updated incident information is provided. Incidents include any event that impacts transportation system operation ranging from routine incidents (e.g., disabled vehicle at the side of the road) through large-scale natural or human-caused disasters that involve loss of life, injuries, extensive property damage, and multi-jurisdictional response. This also includes special events, closures, and other planned events that may impact the transportation system.
- **Incident Report** - Report of an identified incident including incident location, type, severity and other information necessary to initiate an appropriate incident response.
- **Incident Response Coordination** - Incident response procedures and current incident response status that are shared between allied response agencies to support a coordinated response to incidents. This flow provides current situation information, including a summary of incident status and its impact on the transportation system and other infrastructure, and current and planned response activities. This flow also coordinates a positive hand off of responsibility for all or part of an incident response between agencies.
- **Incident Response Status** - Status of the current incident response including a summary of incident status and its impact on the transportation system, traffic management strategies implemented at the site (e.g., closures, diversions, traffic signal control overrides), and current and planned response activities.
- **Incident Status** - Information gathered at the incident site that more completely characterizes the incident and provides current incident response status.
- **Infrastructure Monitoring Sensor Control** - Data used to configure and control infrastructure monitoring sensors.
- **Infrastructure Monitoring Sensor Data** - Data read from infrastructure-based sensors that monitor the condition or integrity of transportation infrastructure including bridges, tunnels,

interchanges, pavement, culverts, signs, transit rail or guideway, and other roadway infrastructure. Includes sensor data and the operational status of the sensors.

- **Intermodal Freight Archive Data** - Information describing demand at intermodal freight terminals including loading/unloading activities of trailers and containers. Content may include a catalog of available information, the actual information to be archived, and associated meta data that describes the archived information.
- **Intermodal Freight Event Information** - Plans for movement of intermodal freight from the depot area possibly impacting traffic. May also include requests for special treatment at traffic signals or dynamic lane management systems.
- **Intermodal Freight Traffic Confirmation** - Confirmation that details concerning the movement of intermodal freight on the roadway network have been received and processed. May also include information on traffic conditions affecting the depot including information concerning any special traffic control accommodations or restrictions for commercial vehicles.
- **Intersection Status** - Intersection status including current operational status, signal phase and timing information, intersection geometry, surface conditions, warnings of potential violations or hazardous conditions, and approaching vehicle information. This may include information about the position, velocity, acceleration, and turning status of approaching vehicles.
- **Local Signal Priority Request** - Request from a vehicle to a signalized intersection for priority at that intersection.
- **Local Signal Preemption Request** - Direct control signal or message to a signalized intersection that results in preemption of the current control plan and grants right-of-way to the requesting vehicle.
- **Maintenance and Construction Dispatch Information** - Information used to dispatch maintenance and construction vehicles, equipment, and crews and information used to keep work zone crews informed. This information includes routing information, traffic information, road restrictions, incident information, environmental information, decision support information, maintenance schedule data, dispatch instructions, personnel assignments, alert notifications, and corrective actions.
- **Maintenance and Construction Dispatch Status** - Current maintenance and construction status including work data, operator status, crew status, and equipment status.
- **Maintenance and Construction Equipment Repair Status** - Current maintenance and repair status of the maintenance and construction vehicle fleet and other support equipment. This information includes a record of all maintenance and repair activities performed.
- **Maintenance and Construction Fleet Information** - Information supporting maintenance of the maintenance and construction vehicle fleet and other support equipment. This information includes vehicle status and diagnostic information, vehicle utilization, and coordination of when vehicles will be available for preventative and corrective maintenance.
- **Maintenance and Construction Resource Coordination** - Request for road maintenance and construction resources that can be used in the diversion of traffic (cones, portable signs), clearance of a road hazard, repair of ancillary damage, or any other incident response.
- **Maintenance and Construction Resource Request** - Request for road maintenance and construction resources that can be used in the diversion of traffic (cones, portable signs), clearance of a road hazard, repair of ancillary damage, or any other incident response. The request

may poll for resource availability or request pre-staging, staging, or immediate dispatch of resources.

- **Maintenance and Construction Resource Response** - Current status of maintenance and construction resources including availability and deployment status. General resource inventory information covering vehicles, equipment, materials, and people and specific resource deployment status may be included.
- **Maintenance and Construction Vehicle Conditions** - Vehicle diagnostics information that is collected, filtered, and selectively reported by a maintenance and construction vehicle. The information includes engine temperature, mileage, tire wear, brake wear, belt wear, and any warnings or alarms concerning the operational condition of the vehicle and ancillary equipment.
- **Maintenance and Construction Vehicle Location Data** - The current location and related status (e.g., direction and speed) of the maintenance/construction vehicle.
- **Maintenance and Construction Vehicle Operational Data** - Data that describes the maintenance and construction activity performed by the vehicle. Operational data includes materials usage (amount stored and current application rate), operational state of the maintenance equipment (e.g., blade up/down, spreader pattern), vehicle safety status, and other measures associated with the operation of a maintenance, construction, or other special purpose vehicle. Operational data may include basic operational status of the vehicle equipment or a more precise record of the work performed (e.g., application of crack sealant with precise locations and application characteristics).
- **Maintenance and Construction Work Plans** - Future construction and maintenance work schedules and activities including anticipated closures with anticipated impact to the roadway, alternate routes, anticipated delays, closure times, and durations.
- **Multimodal Archive Data** - Operational information from alternate passenger transportation modes including air, rail transit, taxis, and ferries. Content may include a catalog of available information, the actual information to be archived, and associated meta data that describes the archived information.
- **Multimodal Crossing Status** - Indication of operational status and pending requests for right-of-way from equipment supporting the non-highway mode at multimodal crossings.
- **Multimodal Information** - Schedule information for alternate mode transportation providers such as train, ferry, air and bus.
- **Multimodal Service Data** - Multimodal transportation schedules and other service information.
- **On-Board Vehicle Data** - Information about the commercial vehicle stored on-board (for maintenance purposes, gate access, cargo status, lock status, etc.).
- **On-Board Vehicle Request** - Request for on-board vehicle data.
- **Parking Demand Management Request** - Request to change the demand for parking facility use through pricing or other mechanisms.
- **Parking Demand Management Response** - Response to parking demand management change requests indicating level of compliance with request.
- **Parking Information** - General parking information and status, including current parking availability.
- **Parking Lot Data Request** - Request for parking lot occupancy, fares, and availability. The request can be a subscription that initiates as-needed information updates as well as a one-time request for information.

- **Parking Lot Inputs** - Instructions for operation of local parking facilities to support regional traffic management objectives (e.g. which parking lot exits to use). Also, includes inputs from traffic sensors to support calculation of parking lot occupancy and support more effective management of parking entrances and exits.
- **Passenger Information** - Provides detailed passenger information. May include scheduled pickup and dropoff information, and passenger (on-board) status. For paratransit and demand-responsive requests. Also, for school bus.
- **Patient Status** - Information that supports assessment of the patient's condition. Information could include general categorization of patient status, patient vital signs, pertinent medical history, and emergency care information.
- **Payment** - Payment of some kind (e.g., toll, parking, fare) by traveler which, in most cases, can be related to a credit account.
- **Payment Requests** - Request for payment from financial institution.
- **Payment Violation Notification** - Notification to enforcement agency of a toll, parking, or transit fare payment violation.
- **Personal Transit Information** - General and personalized transit information for a particular fixed route, flexible route, or paratransit system.
- **Qualified Environmental Conditions Data** - Current road conditions (e.g., surface temperature, subsurface temperature, moisture, icing, treatment status) and surface weather conditions (e.g., air temperature, wind speed, precipitation, visibility) that has had quality checks performed on it and has been formatted and consolidated by the Clarus system. Attributes relating to the data collection (and aggregation) are also included.
- **Railroad Advisories** - Real-time notification of railway-related incident or advisory.
- **Railroad Schedules** - Train schedules, maintenance schedules, and other information from the railroad that supports forecast of HRI closures.
- **Remote Surveillance Control** - The control commands used to remotely operate another center's sensors or surveillance equipment so that roadside surveillance assets can be shared by more than one agency.
- **Request for Bad Tag List** - Request for list of bad vehicle tag IDs.
- **Request for Payment** - Request to deduct cost of service from user's payment account.
- **Request for Vehicle Measures** - Request for vehicle performance and maintenance data collected by onboard sensors.
- **Resource Coordination** - Coordination of resource inventory information, specific resource status information, resource prioritization and reallocation between jurisdictions, and specific requests for resources and responses that service those requests.
- **Resource Deployment Status** - Status of resource deployment identifying the resources (vehicles, equipment, materials, and personnel) available and their current status. General resource inventory information and specific status of deployed resources may be included.
- **Resource Request** - A request for resources to implement special traffic control measures, assist in clean up, verify an incident, etc. The request may poll for resource availability or request pre-staging, staging, or immediate deployment of resources. Resources may be explicitly requested or a service may be requested and the specific resource deployment may be determined by the responding agency.

- **Reversible Lane Control** - Control of automated reversible lane configuration and driver information systems.
- **Reversible Lane Status** - Current reversible lane status including traffic sensor and surveillance data and the operational status and mode of the reversible lane control equipment.
- **Right-of-Way Request Notification** - Notice that a request has occurred for signal prioritization, signal preemption, pedestrian call, multi-modal crossing activation, or other source for right-of-way.
- **Road Network Conditions** - Current and forecasted traffic information, road and weather conditions, and other road network status. Either raw data, processed data, or some combination of both may be provided by this architecture flow. Information on diversions and alternate routes, closures, and special traffic restrictions (lane/shoulder use, weight restrictions, width restrictions, HOV requirements) in effect is included along with a definition of the links, nodes, and routes that make up the road network.
- **Road Network Status Assessment** - Assessment of damage sustained by the road network including location and extent of the damage, estimate of remaining capacity, required closures, alternate routes, necessary restrictions, and time frame for repair and recovery.
- **Road Weather Information** - Road conditions and weather information that are made available by road maintenance operations to other transportation system operators.
- **Roadway Information System Data** - Information used to initialize, configure, and control roadside systems that provide driver information (e.g., dynamic message signs, highway advisory radio, beacon systems). This flow can provide message content and delivery attributes, local message store maintenance requests, control mode commands, status queries, and all other commands and associated parameters that support remote management of these systems.
- **Roadway Information System Status** - Current operating status of dynamic message signs, highway advisory radios, beacon systems, or other configurable field equipment that provides dynamic information to the driver.
- **Roadway Maintenance Status** - Summary of maintenance fleet operations affecting the road network. This includes the status of winter maintenance (snow plow schedule and current status).
- **Roadway Safety Data** - Information about potential safety hazards in the vehicle path such as stalled vehicles, wrong way drivers, debris, or standing water.
- **Roadway Warning System Control** - Information used to configure and control roadway warning systems.
- **Roadway Warning System Status** - Current operating status of roadway warning systems.
- **Selected Routes** - Routes selected based on route request criteria.
- **Short Range Communications Status** - Status of the short range communications equipment including the current state or mode of operation and the current equipment status.
- **Signal Control Commands** - Control of traffic signal controllers or field masters including clock synchronization.
- **Signal Control Status** - Operational and status data of traffic signal control equipment including operating condition and current indications.
- **Signal Fault Data** - Faults from traffic signal control equipment.
- **Speed Monitoring Control** - Information used to configure and control automated speed monitoring, speed warning, and speed enforcement systems.

- **Speed Monitoring Information** - System status including current operational state and logged information including measured speeds, warning messages displayed, and violation records.
- **Suggested Route** - Suggested route for a dispatched emergency or maintenance vehicle that may reflect current network conditions and the additional routing options available to en route emergency or maintenance vehicles that are not available to the general public.
- **Threat Information** - Threats regarding transportation infrastructure, facilities, or systems detected by a variety of methods (sensors, surveillance, threat analysis of advisories from outside agencies, etc.
- **Threat Information Coordination** - Sensor, surveillance, and threat data including raw and processed data that is collected by sensor and surveillance equipment located in secure areas.
- **Toll Data** - Current toll schedules for different types of vehicles as well as advanced toll payment information.
- **Toll Data Request** - Request made to obtain toll schedule information or pay a toll in advance. The request can be a subscription that initiates as-needed information updates as well as a one-time request for information.
- **Toll Instructions** - Information provided to configure and support toll plaza operations including toll pricing information.
- **Toll Transactions** - Detailed list of transactions from a toll station.
- **Track Status** - Current status of the wayside equipment and notification of an arriving train.
- **Traffic Archive Data** - Information describing the use and vehicle composition on transportation facilities and the traffic control strategies employed. Content may include a catalog of available information, the actual information to be archived, and associated meta data that describes the archived information.
- **Traffic Control Priority Request** - Request for signal priority at one or more intersections along a particular route.
- **Traffic Flow** - Raw and/or processed traffic detector data which allows derivation of traffic flow variables (e.g., speed, volume, and density measures) and associated information (e.g., congestion, potential incidents). This flow includes the traffic data and the operational status of the traffic detectors.
- **Traffic Images** - High fidelity, real-time traffic images suitable for surveillance monitoring by the operator or for use in machine vision applications.
- **Traffic Information for Media** - Report of traffic conditions including traffic incident reports and traffic images for public dissemination through the media. The reports may also include information on diversions and alternate routes, closures, and special traffic restrictions in effect.
- **Traffic Metering Control** - Control commands and operating parameters for ramp meters, interchange meters, mainline meters, and other systems equipment associated with roadway metering operations.
- **Traffic Metering Status** - Current operational status and operating parameters for ramp meters, interchange meters, mainline meters and other control equipment associated with roadway metering operations.
- **Traffic Probe Data** - Vehicle data that is used to determine traffic conditions. In a basic implementation, the data could be limited to time stamped unique identifiers that can be used to measure a vehicle's progress through the network. In more advanced implementations, the vehicle may report current position, speed, and heading and snapshots of recent events including

route information, starts and stops, speed changes, and other information that can be used to estimate traffic conditions.

- **Traffic Sensor Control** - Information used to configure and control traffic sensor systems.
- **Traffic Violation Notification** - Notification to enforcement agency of a detected traffic violation including speed violations, HOV violations, and dynamic lane violations.
- **Traveler Information for Media** - General traveler information regarding incidents, unusual traffic conditions, transit issues, or other advisory information that has been desensitized and provided to the media.
- **Transaction Status** - Response to transaction request. Normally dealing with a request for payment.
- **Transit Archive Data** - Data used to describe and monitor transit demand, fares, operations, and system performance. Content may include a catalog of available information, the actual information to be archived, and associated meta data that describes the archived information.
- **Transit and Fare Schedules** - Transit service information including routes, schedules, and fare information.
- **Transit Emergency Data** - Initial notification of transit emergency at a transit stop or on transit vehicles and further coordination as additional details become available and the response is coordinated.
- **Transit Fare Coordination** - Fare and pricing information shared between local/regional transit organizations.
- **Transit Fare and Passenger Status** - Information provided from the traveler location that supports fare payments, passenger data, and associated record-keeping.
- **Transit Fare Information** - Information provided by transit management that supports fare payment transactions and passenger data collection.
- **Transit Incident Information** - Information on transit incidents that impact transit services for public dissemination.
- **Transit Information Request** - Request for transit operations information including schedule and fare information. The request can be a subscription that initiates as-needed information updates as well as a one-time request for information.
- **Transit Information User Request** - Request for special transit routing, real-time schedule information, and availability information.
- **Transit Multimodal Information** - Transit schedule information for coordination at modal interchange points.
- **Transit Schedule Adherence Information** - Dynamic transit schedule adherence and transit vehicle location information.
- **Transit Schedule Information** - Current and projected transit schedule information used to initialize the transit vehicle with a vehicle assignment, monitor schedule performance, and develop corrective actions on-board.
- **Transit Service Coordination** - Schedule coordination information shared between local/regional transit organizations.
- **Transit System Status Assessment** - Assessment of damage sustained by the public transportation system including location and extent of the damage, current operational status including an estimate of remaining capacity and necessary restrictions, and time frame for repair and recovery.

- **Transit Traveler Information** - Transit information prepared to support transit users and other travelers. It contains transit schedules, real-time arrival information, fare schedules, alerts and advisories, and general transit service information.
- **Transit Traveler Request** - Request by a Transit traveler to summon assistance, request transit information, or request any other transit services.
- **Transit User Information** - Information about individual transit users boarding a transit vehicle, used to track a user's progress on a scheduled transit trip.
- **Transit Vehicle Conditions** - Operating conditions of transit vehicle (e.g., engine running, oil pressure, fuel level and usage).
- **Transit Vehicle Loading Data** - Data collected on board the transit vehicle relating to passenger boarding and alighting.
- **Transit Vehicle Location Data** - Current transit vehicle location and related operational conditions data provided by a transit vehicle.
- **Transit Vehicle Operator Information** - Transit service instructions, wide area alerts, traffic information, road conditions, and other information for both transit and paratransit operators.
- **Transit Vehicle Schedule Performance** - Estimated times of arrival and anticipated schedule deviations reported by a transit vehicle.
- **Transportation Information for Operations** - Information on the state of transportation system operations including traffic and road conditions, advisories, incidents, transit service information, weather information, parking information, and other related data.
- **Transportation System Status** - Current status and condition of transportation infrastructure (e.g., tunnels, bridges, interchanges, TMC offices, maintenance facilities). In case of disaster or major incident, this flow provides an assessment of damage sustained by the surface transportation system including location and extent of the damage, estimate of remaining capacity and necessary restrictions, and time frame for repair and recovery.
- **Traveler Archive Data** - Data associated with traveler information services including service requests, facility usage, rideshare, routing, and traveler payment transaction data. Content may include a catalog of available information, the actual information to be archived, and associated meta data that describes the archived information.
- **Vehicle Intersection Safety Data** - Vehicle path and acceleration data provided by vehicles approaching or occupying an intersection. It identifies the intersection, vehicle position and motion, the anticipated lane and movement that will be used in the intersection, and notification of potential violations or other detected safety hazards.
- **Vehicle Location and Motion** - Data describing the vehicle's location in three dimensions, heading speed, acceleration, braking status, and size.
- **Vehicle Payment Information** - Information provided for payment of tolls and parking fees including identification that can be used to identify the payment account or source and related vehicle and service information that are used to determine the type and price of service requested.
- **Vehicle Payment Request** - Request for information supporting toll and parking payments.
- **Vehicle Payment Update** - Data written to vehicle equipment to support electronic toll collection or parking payment.
- **Vehicle Platoon Coordination** - Coordination of control commands between leader and follower vehicles allowing vehicles to join, coordinate with, and separate from platoons of cooperative

vehicles. This flow shares platoon size, location, and performance parameters between platooned vehicles. It also coordinates maneuvers between platooned vehicles, including maneuvers as vehicles join and leave the platoon.

- **Vehicle Profile** - Information about a vehicle such as vehicle make and model, fuel type, engine type, average emissions, average fuel consumption, passenger occupancy, or other data that can be used to classify vehicle eligibility for access to specific lanes, road segments, or regions.
- **Vehicle Signage Data** - In-vehicle signing data that augments regulatory, warning, and informational road signs and signals. The information provided would include static sign information (e.g., stop, curve warning, guide signs, service signs, and directional signs) and dynamic information (e.g., current signal states, grade crossing information, local traffic and road conditions, advisories, and detours).
- **Video Surveillance Control** - Information used to configure and control video surveillance systems.
- **Weather Information** - Accumulated forecasted and current weather data (e.g., temperature, pressure, wind speed, wind direction, humidity, precipitation, visibility, light conditions, etc.).
- **Work Plan Coordination** - Coordination of work plan schedules and activities between maintenance and construction organizations or systems. This information includes the work plan schedules and comments and suggested changes that are exchanged as work plans are coordinated and finalized.
- **Work Plan Feedback** - Comments and suggested changes to proposed construction and maintenance work schedules and activities. This information influences work plan schedules so that they minimize impact to other system operations and the overall transportation system.
- **Work Zone Information** - Summary of maintenance and construction work zone activities affecting the road network including the nature of the maintenance or construction activity, location, impact to the roadway, expected time(s) and duration of impact, anticipated delays, alternate routes, and suggested speed limits. This information may be augmented with images that provide a visual indication of current work zone status and traffic impacts.
- **Work Zone Status** - Current work zone status including current location (and future locations for moving work zones), impact to the roadway, required lane shifts, expected time(s) and duration of impact, anticipated delays, alternate routes, and suggested speed limits.
- **Zone Warning Information** - Notification of a work zone emergency or safety issue. This flow identifies that a work zone emergency or safety issue has occurred so that warnings may be generated by more than one system in the work zone.
- **Work Zone Warning Status** - Status of a work zone safety monitoring and warning devices. This flow documents system activations and includes additional supporting information (e.g., an image) that allows verification of the alarm.

## **APPENDIX F**

TSMO Advisory Committee Roster

**Osceola County**

Joe del Zaballero

Traffic Operations Engineer

P: 407-742-0623

Alternate: Linette Matheny

**Seminole County**

Charlie Wetzel

County Traffic Engineer

P: 407-665-5684

Alternate: Steve Douglas 407-665-5684

**Osecola County**

Edgar Bryant

Senior Traffic Engineer

P: (407) 742-6648

Alternate: Mary Moskowitz

**City of Altamonte Springs**

Brett Blackadar

P: 407-571-8538

Chief Transportation Engineer

Alternate: Tim Wilson 407-571-8146

**Orange County**

Hazem El-Assar

Chief Engineer

P: (407) 836-7866

**City of Apopka**

Jay Davoll, P.E.

City Engineer

P: (407) 703-1712

**Orange County**

Brian Sanders

Chief Planner

P: 407-836-8022

Alternate: Renzo Nastasi (407) 836-8072

**City of Casselberry**

Kelly Brock

City Engineer

P: 407-262-7725

Alternate: Mark Gisclar

**Seminole County**

Jean Jreij

Public Works Director

P: (407) 665-5601

Alternate: Shad Smith (407) 665-5707

**City of Edgewood**

Councilman Lee Chotas

**City of Kissimmee**

Jim Arsenault

P: 407-518-2277

Alternate: Nabil Muhaisen

**City of Lake Mary**

John Omana

Community Development Director

P: (407) 585-1454

Alternate: Steve Noto (407) 585-1440

**City of Longwood**

Chris Kintner

Community Development Coordinator

P: (407) 260-3468

**City of Maitland**

Noel Cooper

Transportation Engineer

P: (407) 539-6217

Alternate: Rick Lemke Phone: 407-539-6216
